Occupations that require a minimum age of 18 include:
Manufacture or storage of explosives;

Driving or helping on a motor vehicle;
Coal mining;
Logging and sawmilling;
Operation of power-driven woodworking machines;
Exposure to radioactive substances and to ionizing radiations;
Operation of elevators and other power-driven hoisting apparatus;
Operation of power-driven metal forming, punching, and shearing machines;
Mining, other than coal, such as sand and gravel quarries and clay pits;
Slaughtering and meat packing establishments and rendering plants;
Operation of certain power-driven machines;
Operation of certain power-driven paper products machines;
Manufacture of brick, tile, and kindred products;
Operation of power-driven circular saws, band saws, and guillotine shears;
Wrecking, demolition, and shipbreaking operations;
Roofing operations;
Excavation operations.

14 IS MINIMUM AGE FOR SPECIFIED OCCUPATIONS OUTSIDE SCHOOL HOURS

Employment of 14-and 15-year-old youths is restricted to certain occupations outside school hours only, with a limitation on hours of work.

No 14- and 15-year-old minor may be employed: During school hours; between 7 p.m. and 7 a.m. local time; more than 3 hours a day on school days; more than 18 hours weekly in school weeks; more than 8 hours a day on non-school days; and more than 40 hours a week in non-school weeks.

Minors 14 and 15 years old cannot work: In manufacturing occupations; in processing occupations (except certain retail, food service, and limited work in gasoline service establishments); in performance of any duties in workrooms or workplaces where goods are manufactured; in public messenger service; in the operation or tending of any power-driven machinery other than office machines; and in most occupations (except office or sales work) in connection with transportation, warehousing and storage, communications and public utilities, and construction.

Children under 14 years of age may not be employed in any occupation unless specifically exempt.

FEDERAL MINIMUM WAGE AND OVERTIME

If your work is covered by the federal law, you may be entitled to the minimum wage and overtime benefits of the Federal Wage Hour Law.

CAREERS IN APPRENTICESHIP

If you have mechanical ability and do not plan to attend a college or university, you may be looking ahead toward a career in a skilled craft. If so, your best opportunity, whether you are just preparing for a working life or have had some previous work experience and want to improve your prospect for the future, is by way of apprenticeship.

This is a system of learning by doing and earning while learning. It combines on-the-job training with related technical instructions by experienced individuals. Only through all-around training as provided by apprenticeship will you be able to master the skills of a particular trade. Once this mastery has been acquired, you will possess something that no one can ever take from you and something you can always market within industry.

QUALIFIED APPLICANTS CHOSEN

The demand for skilled workers persists continually – but on a limited basis. This is important to remember because the selection of potential apprentice candidates becomes highly competitive. Through testing and interviewing and with much consideration given to educational background, the best qualified applicants are chosen for entrance into apprenticeship training programs.

Today, in most of the skilled trades, the apprentice must be a high school graduate who has completed courses in mathematics and certain sciences and is able to pass the General Aptitude Test Batteries which are given by the State Employment Service.

If you are looking forward to a successful career through apprenticeship, your chance for success will be made greater by preparing yourself properly early in high school to meet the entrance qualifications of a particular skilled craft.

SPECIFIC APPRENTICESHIP INFORMATION

You may obtain specific information on the subject of apprenticeship from your local High School Guidance Counselor, the Director of Vocational Education, the Principal of your High School, or the Trade and Industry Representative serving your locality. The Ohio State Employment Service, employer associations, and trade unions are always glad to help young men make the right choice.

The Ohio State Apprenticeship Council of the State Department of Industrial Relations works with the Bureau of Apprenticeship and Training of the U.S. Department of Labor in the establishment of apprenticeship programs that will develop the types of skilled workers required to meet the demands of modern industry.

A Study of Practical Nurses Who Have Been Licensed in Iowa But Are Not Presently Employed in Iowa as Practical Nurses, Iowa Practical Nursing Sub-Study.

Iowa Univ., Iowa City. Div. of Medical Services
MF AVAILABLE IN VT-ERIC SET.
Pub Date - 31Dec66 63p.

*PRACTICAL NURSES; *UNEMPLOYED; *OCCUPATIONAL SURVEYS; STATE SURVEYS; MANPOWER UTILIZATION; QUESTIONNAIRES; *INDIVIDUAL CHARACTERISTICS; EMPLOYMENT EXPERIENCE; CERTIFICATION; SOCIAL CHARACTERISTICS; EDUCATIONAL EXPERIENCE; *HEALTH OCCUPATIONS EDUCATION
IOWA

Recognizing the disparity between the number of practical nurses licensed and the number employed as practical nurses, the study attempts to discover the factors which influence this under-utilization in order to improve the situation. A questionnaire eliciting information about background, reasons for leaving the work force, and factors important in determining re-entry into the work force was mailed to 125 practical nurses licensed by education in the following three categories: (1) residing in Iowa and holding current licenses but unemployed or employed in non-health occupations, (2) holding current licenses but residing outside the state, and (3) residing in Iowa but having inactive licenses. The major conclusion was that there is little that outside forces can do to facilitate the return of this group to employment as practical nurses in Iowa but that most do plan to return as family responsibilities permit. Some recommendations were that: (1) nurses for all fields be prepared in larger numbers, (2) nurses be prepared in approved professional, technical, and practical nursing programs, (3) applicants be assisted to select the type of program for which their abilities best suit them, (4) quality nursing education programs be expanded. ACKNOWLEDGMENTS

The authors express sincere appreciation to:

the Advisory Committee and Director of the Research Coordinating Unit, Iowa Department of Public Instruction, for their partial financial support which made this study possible,

Dr. Robert M. Tomlinson, Director of the Project, An Integrated Longitudinal Study of Practical Nursing from which this sub-study stemmed, who gave us freedom to use pertinent data collected for that Project and who, at intervals, has given assistance during this study,

Mildred Freel, who carried the major responsibility for the instrument development and data collection,

Miss Freel, Carole Hoadley, Ronald Czaja, and Warren Suzuki for their assistance in data analysis,

Linda Forbes, Carma Grout, Dianna Reid, and Bonnie Poulos, secretaries, who endured the persistant clerical demands of this study,

Milferd E. Rosendahl for her expert assistance in proof-reading this final report prior to its printing, and to

our families who made supportive adjustments to our irregular and late hours of work during the study and the preparation of this report.

We thank them all!

PREFACE

Definition of Terms Used

For purpose of clarification from the outset, several special terms are defined preceeding the report of this study.

Nursing:--Nursing is defined

> "as one of the resources in a community for the care of the sick, the prevention of illness, and the promotion of health which is carried on under medical authority. Its distinctive function is the close and individualized service to the patient which may vary with his state of health from one of dependence, in which the nurse performs for him what he cannot do for himself, through supportive and rehabilitative care, physical and emotional, to self-direction of his own health. Nursing is primarily patient-centered. It gives service directly through treatment, general physical care, and health instruction to the patient and his family and through the coordination of nursing with other community services essential to the patient's health needs."[8]

Registered Nurse:

> Graduate of an educational program in nursing who has been licensed to practice professional nursing.

Professional nurse:

> Mildred L. Montag defines the professional nurse "as the nurse prepared to carry out a range of functions which are highly complex and dependent upon expertness and skill acquired through long periods of training. Her functions include:
>
> 1. the identification or diagnosis of the nursing problem and the recognition of its many related aspects.
> 2. the decision upon a course of action to be followed for the solution of the problem.
> 3. with assistance of the other members of the nursing and health team, both interprofessional and intraprofessional, the development of a satisfactory plan of nursing care, including therapeutic treatments for which the physician has delegated responsibility to the nurse.
> 4. the continued direction of the program of nursing toward its optimum accomplishment, and the performance of those aspects which demand the skill and judgement which she is best prepared to use.

---

8. Joint Curriculum Conference, Report of the Proceedings of the Conference, November 13, 14, 15, 1960 National League for Nursing, New York, 1951), p. 21.

5. the evaluation of the process and the results of nursing for the continuous improvement of care of the patient and the practice of nursing."[9]

Licensed practical nurse:

"A person licensed as a practical nurse practitioner prepared for two roles:

1. Under the supervision of a registered professional nurse or physician, to give nursing care to patients in situations relatively free of scientific complexity.

2. In a close working relationship, to assist registered professional nurses in giving nursing care to patients in more complex situations."[10]

Practical nursing program:

"This program, usually one year in length, is self-contained, complete and satisfactory for its own purpose, preparing exclusively for practical nursing. Its objective is to prepare a worker who will share in giving direct care to patients. The practical nursing program is intended for individuals who will find satisfaction

1. in nursing functions consistent with short-term preparation, and
2. in practicing nursing within a limited range of situations for which patients require care.

A program leading to a certificate or diploma in practical nursing may be organized and operated under public education, hospitals, or other community agencies. Most are administered through the public school system. The next largest number are controlled by hospitals. A few are under universities, colleges, and community agencies."[11]

Licensed in good standing:

Once ever issued a license to practice the licensee holds this status unless his license is legally revoked for just cause.

Current licensure:

Licensed in good standing with license initially issued or renewed for the current year. The law provides for annual renewal and current licensure is required when engaged in nursing practice.

9. Mildred L. Montag, The Education of Nursing Technicians (New York: G. P. Putnum's Sons, 1961), pp. 4-5.

10. Nursing Education Programs Today (National League for Nursing, New York, 1962), pp. 9-10

11. Ibid., p. 9.

Inactive licensure:

Licensed in good standing but licensee voluntarily does not renew license for current year. Licensee may not practice nursing while holding an inactive license.

Licensed by endorsement:

Licensed by the Iowa Board of Nursing to practice nursing in Iowa by virtue of holding a valid license in another state.

Board of Nursing out-of-state certification:

Act of the Iowa Board of Nursing sending credentials of an Iowa licensee to a Board of Nursing in another state for application for licensure in that other state.

State Board of Nursing (or Board of Nurse Examiners):

The regulatory board of each state which is responsible for the educational standards of professional and practical nursing programs. It approves schools of nursing in the state and renews licenses for professional and practical nurses. In Iowa, this official board is known as the Iowa Board of Nursing.

State Division of Vocational Education:

The division of a state department of education which cooperates with public education institutions as they administer practical nursing programs partially funded by state and federal funds appropriated for this purpose.

State-approved practical nursing programs:

Programs approved by the State Board of Nursing. Programs operated in cooperation with the State Division of Vocational Education must also be approved by this Division. Only graduates of programs approved by the State Board of Nursing are eligible for examination to become licensed as practical nurses. (In California and Texas graduates are licensed as vocational nurses.)

State board examination:

A written examination administered by the State Board of Nursing. Upon passing this examination graduates become eligible for licensure as practical nurses and may use the title "Licensed Practical Nurse." (The title "Licensed Vocational Nurse" is used in California and Texas.)

An Integrated Longitudinal Study of Practical Nursing (PNS):

A 39-month research project being conducted currently by the University of Illinois in cooperation with The University of Iowa and funded by the U.S. Office of Education. This project is commonly referred to as the "Practical Nursing Study". Reference to this research project is by the abbreviation PNS.

Iowa Practical Nursing Sub-Study (IPNSS):

is the common term used for the study reported on the following pages of this publication. It is a complete research study in itself but is supplemental to the PNS. In this report, this study is referred to by the abbreviation, IPNSS.

Sub-group classifications:

PNS and IPNSS subjects grouped by licensure status, place of residence, and preparatory basis for licensure.

1. CIED group: Currently licensed, In-state resident, licensed on the basis of EDucation.
2. COED group: Currently licensed, Out-of-state resident, licensed on the basis of EDucation.
3. IIED group: Inactive licensure, In-state resident, licensed on the basis of EDucation.
4. IOED group: Inactive licensure, Out-of-state resident, licensed on basis of EDucation.
5. CIX group: Currently licensed, In-state resident, licensed on the basis of eXperience.
6. COX group: Currently licensed, Out-of-state resident, licensed on the basis of eXperience.
7. IIX group: Inactive licensure, In-state resident, licensed on the basis of eXperience.
8. IOX group: Inactive licensure, Out-of-state resident, licensed on basis of eXperience.

CHAPTER I

INTRODUCTION

Nursing is challenged to increase its complement of skilled practitioners in response to the ever-growing demands of modern society. Among factors influencing these demands are (1) increased population, (2) expanding medical knowledge, (3) greater public awareness of preventive and therapeutic health measures, (4) increasing number and use of available medical insurance plans, and (5) recent federal legislation which subsidizes health care for specific sub-groups of the population.

Demands for nursing service exceed the capacity of existing programs in nursing education to supply graduates in sufficient numbers to meet the needs. By 1970, it has been estimated, 270,000 additional nurses will be needed over and above the normally expected increase in nursing resources. This prediction was made even prior to the enactment of the Medicare provisions in the Social Security Amendments of 1965 (Public Law 89-97, Title XVIII). This legislation provides for hospital insurance for people age 65 and over, covering hospitalization and related services such as post-hospital extended care and home health services.

In an attempt to meet these ever-increasing needs for nursing service, qualified nursing personnel must be prepared in even greater numbers. This includes licensed practical nurses who are integral members of the nursing team.

Throughout the country there are relatively uniform practical nurse licensure provisions and educational programs to prepare practical nurses. All fifty states and the territories now provide for licensure of this

practitioner. Legislation and procedures for the approval of educational programs have been established. Presently there are approximately 1000 approved programs of practical nurse education from which new licensees have graduated.

The statutes of the State of Iowa have provided for licensure of practical nurses by the Iowa Board of Nursing since July 1, 1949 and require annual renewal for the practitioner of practical nursing to be currently licensed in good standing. During the first two years following initiation of licensure requirements the majority of persons were granted licensure under a "waiver" provided by a grandfather clause in the law which permitted licensure on the basis of experience and recommendation. During this same period of time, one-year educational programs to prepare practical nurses were improved and expanded and this growth continues. Since July 1, 1951 it is possible to be licensed by the Iowa Board of Nursing in one of two ways; graduation from an approved program in practical nursing or, completion of a specified portion of an approved program in professional nursing. In the latter case, permission to sit for the licensure examination is determined by the Iowa Board of Nursing only after its evaluation deems the educational experiences of the applicant to be sufficiently adequate to portend safe nursing care.

In Iowa there are 22 programs of practical nurse education, all approved by the Iowa Board of Nursing. Nineteen of these receive partial support from funds administered by the Division of Vocational Education, Iowa Department of Public Instruction. The remaining three are administered by private, parochial hospitals.

Requirements for admission to Iowa programs in practical nursing from July 1, 1949 through June 30, 1964 included: (1) a minimum age of 18 to

assure candidates would meet the required age of 19 to apply for licensure after satisfactorily completing the one-year program. The maximum age for admission was usually 55. (2) evidence of having had an educational background of a minimum of 10 grades of schooling satisfactorily completed. There was no provision for educational equivalency.

On July 1, 1964 the Iowa Nurse Practice Act was changed by statute to require: (1) a minimum licensure age of 18 which permitted admission to programs at age 17. The maximum age remains at usually 55. (2) a high school diploma or its equivalency determined by achievement at the 12th grade level on the General Education Development (GED) Test.

Background of the Study

On June 1, 1965 the United States Office of Education, under provisions of the Vocational Education Act of 1963, Section 4(c), approved Project Number 5-0126, Contract Number 5-85-038, entitled An Integrated, Longitudinal Study of Practical Nursing (hereafter referred to as the PNS). The University of Illinois is the prime contractor and The University of Iowa, under sub-contract, is cooperating throughout the entire 39-month period of the PNS which will continue through August 31, 1968.

Dr. Robert M. Tomlinson, Department of Vocational-Technical Education, College of Education, University of Illinois, is the Principal Investigator. Elizabeth E. Kerr, Director, Program in Health Occupations Education, Division of Medical Services, The University of Iowa, is the Associate Investigator. Miss Kerr also serves as Head State Consultant, Health Occupations Education Section, Division of Vocational Education, Iowa Department of Public Instruction and is Director of this study (Iowa Practical Nurse Sub-Study, hereafter referred to as IPNSS).

The long-range goal of the PNS is the improvement of nursing services through the improvement of student selection procedures in programs of practical nursing, the educational programs themselves (including curriculum and instructional staff) and the utilization of graduates. This study will not attempt to implement changes but will provide new knowledge and relationships in a meaningful manner that may be applied by those directly responsible for preparing practical nurses and utilizing their services.

The PNS is being conducted in three phases with the inclusive dates and objectives of each as follows:

PHASE I. - September 1965 to September 1966:

Objective: to identify the knowledges, functions, and occupational patterns of a selected sample of practical nurses who are licensed on the basis of having attended an approved nursing education program.

PHASE II. - January 1966 to February 1968:

Objectives: (1) to determine the characteristics of all applicants to, students in, and graduates of selected programs of practical nursing and to identify their relationships, and (2) to determine the characteristics of a selected sample of programs of practical nursing to identify those criteria related to student success and the occupational patterns of graduates.

PHASE III. - January 1968 to July 1968:

Objective: to do a follow-up of applicants, dropouts, and graduates of the selected programs to determine relationships between the characteristics of the individuals, the programs into which they sought admission or did attend, and their current employment situations.

The PNS is structured to operate concurrently in Illinois and Iowa with a research team working in each State. Throughout the three phases, The University of Iowa is responsible for those aspects related to Iowa.

Phase I was based on the identification of all persons ever licensed to practice practical nursing in Illinois and Iowa. In Iowa, information was obtained from the Iowa Board of Nursing to identify the number of licenses issued each year from the initial license in 1949 through December 31, 1965. See Table 1.

TABLE 1
NUMBER OF PRACTICAL NURSE LICENSES
ISSUED IN IOWA BY YEAR
(Estimated to nearest 10 with total corrected in 1965 figure)

YEAR	NUMBER	YEAR	NUMBER
1949	160	1958	160
1950	670	1959	190
1951	670	1960	220
1952	50	1961	280
1953	30	1962	280
1954	70	1963	330
1955	80	1964	430
1956	180	1965	436
1957	110		

Of the 4,346 practical nurses ever issued a license in Iowa, 80% (3,480) held a current license in Iowa in 1965. Of these 3,480, 3,020 also gave current addresses in Iowa.

With the exception of Dubuque, the geographic distribution of all practical nurses licensed in Iowa through July, 1965 is proportional to the existence of a practical nurse education program in a community and the length of time that program has been in existence. Size of community does not appear to be an important factor. See Tables 2 and 3.

TABLE 2
GEOGRAPHIC DISTRIBUTION OF PRACTICAL NURSES
LICENSED IN IOWA
(As of July, 1965)

LOCATION	NUMBER	%	10% SAMPLE IN PNS	1960 CENSUS (IN 1,000's)	% OF TOTAL IOWA POP. 1960 CENSUS

Burlington	Public		1
Estherville	Public		1
TOTALS 16	13	3	109

For Phase II of the PNS, all practical nurse education programs in Iowa, public and private, were contacted as possible participants. To qualify for participation, it was necessary that a program had graduated at least one class prior to September 1, 1965. All sixteen programs in operation in Iowa qualified, wished to participate and were accepted. Twenty nine of the 32 qualified programs in Illinois were included, making a total of 45 participating programs.

Phase III of the PNS is to start in 1967 and there will be no further reference to it in this report.

Since mobility of the subjects was to be studied in all three phases of the PNS, each of the two States was divided into geographic regions. A map indicating the geographic regions and the locations of the sixteen participating programs in Iowa is shown on the following page.

GEOGRAPHIC REGIONS AND LOCATIONS OF
SIXTEEN IOWA PRACTICAL NURSING PROGRAMS IN PNS

KEY

72	Rural - North
73	Rural - Central
74	Rural - South
61, 62, 64, 65, 66	Metropolitan - Not Including Des Moines
63	Des Moines

Programs Participating in PNS
- Public ✱
- Private - Parochial ●

Programs Established Since PNS ▲

To further carry out the objectives of Phase I it was necessary to reduce the total population of practical nurses ever licensed in Illinois and Iowa. Permission was obtained from the Iowa Board of Nursing to obtain more detailed information concerning a 10% sample of the 4,346 persons licensed in Iowa through 1965. Since licensure numbers had been issued in chronological sequence, a 10% random sample was readily obtained by selecting those practical nurses whose license number ended with number six.

Data collection on the 10% sample was completed at the close of the 1965 licensure renewal period. In July 1965 data were obtained concerning 398 subjects and in January 1966 comparable data were obtained concerning an additional 37 subjects granted initial licensure between the time of the July data collection and December 31, 1965. Therefore, the 10% sample consisted of 435 subjects. Because data for two subjects failed to be included for analysis, the N in the PNS is 433.

Each of these 433 subjects was placed in one of eight groups designated by a letter code according to licensure status, place of residence, and preparatory basis for licensure. See Table 4.

TABLE 4
STATUS OF ALL PRACTICAL NURSES EVER LICENSED BY
THE STATE OF IOWA AS OF DEC. 31, 1965

STATUS	LETTER CODE	NUMBER	PERCENT
CURRENT LICENSE			
In-State Residence, Licensed by Education	(CIED)	220	50.8
Out-of-State Residence, Licensed by Education	(COED)	34	7.9
In-State Residence, Licensed by Experience	(CIX)	82	18.9
Out-of-State Residence, Licensed by Experience	(COX)	12	2.8
SUB-TOTAL		348	80.4
INACTIVE LICENSE			
In-State Residence, Licensed by Education	(IIED)	26	6.0
Out-of-State Residence, Licensed by Education	(IOED)	17	3.9
In-State Residence, Licensed by Experience	(IIX)	34	7.9
Out-of-State Residence, Licensed by Experience	(IOX)	8	1.8
SUB-TOTAL		85	19.6
TOTAL		433	100.0

(NOTE: Official records report six known deceased and there are likely additional such cases not identified. All have been included in the appropriate group on the preceding page.)

For the remainder of this report, reference to these groups will be made by letter code as shown in Table 4 on the preceding page.

Table 5 shows the ages of the PNS sample at initial licensure.

TABLE 5
AGE OF PRACTICAL NURSES AT INITIAL LICENSURE BY STATUS
(PNS 10% SAMPLE)

LICENSED BY EDUCATION

AGE	CIED		COED		IIED		IOED		TOTAL	
	N	%	N	%	N	%	N	%	N	%

The age trends in the above table reflect the two-year "waiver" period when licensure was permitted on the basis of experience through June 30, 1951. Sixty-one percent of the group licensed by experience are now 60 years of age or over. Only 15 of this group of 136 are under age 45.

Table 7 shows the educational preparation of those in the PNS who qualified for licensure on the basis of having attended an approved nursing education program.

TABLE 7
EDUCATIONAL PREPARATION FOR PRACTICAL NURSING

EDUCATIONAL PREPARATION	CIED		COED		IIED		IOED		TOTAL	
	N	%	N	%	N	%	N	%	N	%

TOTALS	220	100	34	100	26	100	17	100	297	100

To obtain more detailed information on the CIED group than was available from the records of the Iowa Board of Nursing, direct contact was made with 100% of its 220 subjects.

Of the 220 which includes six men, 154 (70%) received their practical nurse education in Iowa practical nursing programs and 25 (11%) in out-of-state practical nursing programs. Forty-one (19%) were issued licenses on the basis of having attended a program of professional nursing.

Additional information concerning each included whether or not he was presently employed as a practical nurse. Seventy percent (155) were so employed in Iowa, 58% (127) full-time and 13% (28) part-time.

There seem to be two significant factors contributing to the present unemployment of 47 (21%) of the CIED group: (1) Of the 41 (19%) licensed on the basis of having attended a professional nursing program, 15 (37%) of that group were unemployed. (2) Of the 51 (23%) who completed practical nursing programs in Iowa metropolitan areas other than Des Moines, 14 (27%) were unemployed. See Table 8 on the following page.

The Problem

All areas of Iowa report a shortage of available nurses. Until such time as approved nursing education programs in our State prepare an adequate supply of practitioners to alleviate this shortage, it is imperative that all qualified nursing personnel be utilized to the fullest extent possible.

The number of practical nurses currently licensed in Iowa does not reflect a true picture of practical nurse employment in the State. The group of practical nurses licensed in Iowa but presently not employed as practical nurses in our State indicates there is under-utilization of prepared nursing personnel.

What factors influence this under-utilization and how can this situation be improved?

CHAPTER II

THE STUDY

Purpose of the Study

In view of the problem it seemed advisable to further study the practical nurses in the PNS who have been licensed in Iowa on the basis of educational preparation but are not presently employed as practical nurses in this State to:

1. describe the social, educational and occupational characteristics of this group,
2. determine factors which tend to influence the employment status of this group, and
3. to provide information about future employment plans of this group.

Identification of Subjects

As shown in Table 8, sixty-five (29%) of the CIED group (220) are unemployed, employed in non-health occupations, or moved out of Iowa. Also, according to Table 4 it can be assumed that the COED group (34) and the IIED group (26) are not contributing to nursing care in Iowa. These 125 practical nurses represent a potential source of additional nursing personnel in Iowa and are the subjects in this study.

Procedure and Method of the Study

Data from the PNS provided the basis for the conduct of this study, The Iowa Practical Nursing Sub-Study (IPNSS).

1. Data concerning subjects in the PNS who were licensed on the basis of educational preparation were reviewed.

2. An instrument to collect pertinent data was developed.
3. A format for coding collected data was designed.
4. The instrument and coding procedure were pilot-tested with a sample of unemployed licensed practical nurses in Illinois and revised as necessary.
5. The questionnaire (Appendix C) was mailed to the 125 subjects. It was covered by a letter (Appendix B) explaining the purpose of this study, seeking their cooperation, and assuring them of anonymity in the report of the study. A stamped return envelope was enclosed. two weeks later a duplicate questionnaire and follow-up letter (Appendix D) were sent to those who had not yet responded.
6. Areas investigated include:
   a. Background characteristics including age, sex, rural or urban residence, education, size of family, ages of children, employment pattern, and present employment status.
   b. Reasons for leaving the work force (i.e., marriage, family responsibilities, pregnancy, influence of husband, job dissatisfaction, low pay, etc.)
   c. Factors important in determining possible re-entry into the work force (i.e., financial need, desire for contacts outside the home, change in family responsibilities, increased salaries, better working conditions, etc.)
7. The data collected were coded and key-punched for analysis.
8. Data were analyzed by frequency counts and percentages. Because the N was low, percentages were rounded out to a whole number and cross comparisons for interrelationships were limited.
9. A final report was written for printing and dissemination.

CHAPTER III

REPORT OF THE FINDINGS

Ten of the 125 subjects were never contacted (3 of the CIED group, 4 of the COED group, and 3 of the IIED group). Their questionnaires were returned by mail stamped, "moved and left no forwarding address". Further follow-up with the Iowa Board of Nursing and attempted person-to-person telephone calls failed to locate them.

Ninety (72%) of the 125 questionnaires mailed were completed and returned. One respondent of the IIED group was eliminated from the study when she reported she was licensed on the basis of experience and had never attended a nursing education program. Two subjects returned questionnaires with neither name nor license number identification. As a result, they could not be classified into any sub-group and are not included in the study. Therefore, this report is based on an N of 87, representing 70% of the original 125. See Table 9.

TABLE 9
QUESTIONNAIRES SENT AND RETURNED

IIED	26	26	14	54
TOTALS	280	125	87	70

Characteristics of the Group

The group is predominately of rural background. Thirty-eight percent were born of farm families and 14% born of families living in communities with less than 2,500 population. Sixty-seven percent were born in communities of less than 5,000 population. See Table 10.

TABLE 10
SIZE OF TOWN IN WHICH BORN

POPULATION	CIED N	CIED %	COED N	COED %	IIED N	IIED %	TOTAL N	TOTAL %

	52	100	21	100	14	100	87	100

Fifteen of the fathers were reported deceased or retired with no past occupation identified. Of those identified, about one-half (49%) were farmers, 38% were skilled or semi-skilled workers in non-health occupations and nine percent were unskilled workers in non-health occupations. Four percent were professionals, one a physician. See Table 11.

TABLE 11

	52	100	21	100	14	100	87	100

Among parent's whose educational attainment was reported, the greatest percentage (34%) achieved only eight years of schooling and the next largest percentage (26%) achieved only 12 years. More mothers than fathers completed high school. Thirteen percent of the fathers and 10% of the mothers completed between 13 and 18 years of schoolings. See Tables 13 and 14.

	52	100	21	100	14	100	87	100

In 1965, the youngest age among respondents was 20. Sixty-three percent were between the ages of 20 and 29, 20% were between 30 and 39, 10% between 40 and 49 and seven percent were over 50. Data from the PNS showed five subjects in its CIED group (220) currently licensed in 1965 were 60 or over. See Table 6 on page 12. Of these five, three indicated they were Iowa residents and unemployed. These three individuals are among the seven subjects in this study who are over 60. See Table 16.

TABLE 16

	52	100	20	100	14	100	86	100

Note: One in the COED group did not respond to this item.

It appears that earlier employment experiences in health-related occupations tended to influence seeking educational preparation for practical nursing.

Eighty-seven percent indicated employment experience(s) prior to becoming a L.P.N. Of these, 88% had experience in health-related and 12% in only non-health-related occupations. Thirteen percent had not been employed prior to becoming a LPN. See Table 18.

TABLE 18
EMPLOYMENT BEFORE LICENSURE AS A PRACTICAL NURSE

	48	100	17	100	13	100	78	100

Note: Four in the CIED group, four in the COED group and one in the IIED group did not respond to this item.

Mass media (newspapers, radio, t.v., etc.) were the greatest sources of information through which respondents became acquainted with the preparatory nursing program they attended. Twenty-three percent learned of the program through these media. Following closely in comparatively equal frequencies as sources of information were friends, health occupations personnel, high-school counselors and relatives. See Table 20.

17	1	2	-	-	-	-	1	1
	52	100	21	100	14	100	87	100

Twenty-six percent were employed while enrolled in a preparatory nursing program and 74% were not employed during this time. The 82 responding to this item were the same 82 who identified sources of financial support while enrolled for their nursing education. The only financial source for 72% was parents or relatives and for 24% it was personal earnings. Only four percent were supported through governmental agencies. See Tables 22 and 23.

TABLE 22
WORKED WHILE IN PREPARATORY PROGRAM

RESPONSE	CIED N	CIED %	COED N	COED %	IIED N	IIED %	TOTAL N	TOTAL %

Government Agency	2	4	-	-	1	8	3	4
	50	100	19	100	13	100	82	100

Note: Two each in the CIED and COED group and one in the IIED group did not respond to this item.

Sixty-four percent were licensed on the basis of having completed a program in practical nursing, 54% in Iowa programs and 10% in programs out-of-state. Thirty-six percent were licensed on the basis of having attended a program in professional nursing. See Table 24.

TABLE 24
EDUCATIONAL BASIS FOR IOWA LICENSURE

30 or More	2	4	1	5	-	-	3	3
	47	100	19	100	12	100	78	100

Note: One in each of the CIED, COED, and IIED groups did not respond to this item and six had never married.

Among the respondents there are a large number of children most of whom are young in age. Seventy-eight percent have one child or more. One has eight children all under age 10. Sixty-five percent have 1-3, 12% have 4-7, and 22% have none. The children of 52% are all under 6 years of age, of seven percent are all between 6-11, of seven percent are all between 12-17, and of nine percent are all 18 or over. An additional three percent have one child in each of these age ranges. See Tables 30 and 31.

TABLE 30
NUMBER OF CHILDREN

One In Each Above Range	1	2	1	5	1	7	3	3
	52	100	21	100	14	100	87	100

The mobility rates of individuals in the total group has been relatively low. Nearly one-half (46%) live at the same address as at the time they were initially licensed. Thirty percent have had only one address change since initial licensure and this could be a move ranging in distance from across the street to out-of-state. See Table 32.

TABLE 32
NUMBER OF ADDRESSES SINCE INITIAL LICENSURE (AS OF 1965)

	CIED		COED		IIED		TOTAL	
NUMBER	N	%	N	%	N	%	N	%
1	24	46	8	38	8	57	40	46
2	14	27	9	43	3	22	26	30
3	9	17	2	9	2	14	13	15
4	4	8	1	5	1	7	6	7
5	1	2	1	5	-	-	2	2
	52	100	21	100	14	100	87	100

Comparatively stable geographically, they have also been relatively stable in their employment as practical nurses since initial licensure. Of the 82 responding to this item, 94% have been employed in at least one position as a L.P.N. Thirty-seven percent have held only the one position, 24% have held only two, 15% have held three and 18% have held between four and eight positions. Six percent have never worked as a practical nurse. See Table 33.

TABLE 33
NUMBER OF JOBS AS L.P.N.

	CIED		COED		IIED		TOTAL	
NUMBER	N	%	N	%	N	%	N	%
0	2	4	1	5	2	15	5	6
1	17	35	7	36	6	43	30	37
2	15	31	2	11	3	21	20	24
3	4	8	5	26	3	21	12	15
4	6	12	2	11	-	-	8	10
5	3	6	2	11	-	-	5	6
6	1	2	-	-	-	-	1	1
7	-	-	-	-	-	-	-	-
8	1	2	-	-	-	-	1	1
	49	100	19	100	14	100	82	100

Note: Three in the CIED group and two in the COED group did not respond to this item.

The distance between place of birth and present residence shows thirty-one percent still reside in the same place or within a 25 mile distance, 29% live between 25 and 100 miles and 40% live over 100 miles from their places of birth.

TABLE 34
DISTANCE OF PRESENT RESIDENCE FROM PLACE OF BIRTH

	CIED		COED		IIED		TOTAL	
MILES	N	%	N	%	N	%	N	%
Same Place	5	10	-	-	3	21	8	9
25 or Less	10	19	4	19	5	36	19	22
25-50	9	18	3	14	-	-	12	14
50-100	7	13	3	14	3	21	13	15
100-200	7	13	2	10	1	7	10	11
200 or More	14	27	9	43	2	15	25	29
	52	100	21	100	14	100	87	100

Thirty-nine percent live 50 miles or less from the nursing program in which they were prepared, 24% live between 50-100 miles, 10% between 100-200 miles and 27% live 200 miles or over. Comparing these figures with the low number of addresses since licensure (See Table 32, page 31), it appears that when one does move, the move is a distant one. See Table 35.

TABLE 35
DISTANCE PRESENT RESIDENCE FROM NURSING PROGRAM ATTENDED

	CIED		COED		IIED		TOTAL	
MILES	N	%	N	%	N	%	N	%
This City	10	21	0	-	2	14	12	15
25-less	5	10	6	35	1	7	12	15
25-50	5	10	1	6	1	7	7	9
50-100	11	23	2	12	6	43	19	24
100-200	4	9	1	6	3	22	8	10
200 -	13	27	7	41	1	7	21	27
	48	100	17	100	14	100	79	100

Note: Four in each of the CIED and COED groups did not respond to this item.

The above two tables indicate a relatively low mobility from place of birth, through location of preparatory program, to present residence.

At the time data were collected for the PNS in 1965, these 87 subjects were unemployed or gave out-of-state addresses. Employment status and place of residence of some changed between then and July, 1966 when the data for this sub-study were collected.

Solicitation of the reason for leaving Iowa was primarily aimed at the COED group 24% of whom, in the interim, have returned to Iowa. All of the IIED group are still in Iowa but in this same interim, 15% of the CIED group have left Iowa. As a result, 73% of the total group are now in Iowa and 27% are out-of-state. Of those presently out-of-state, 67% gave "marriage" as the reason for leaving Iowa, 17% left because of influence of parents, relatives, or employer, 12% because of opportunity for experience and four percent because of salary increase. See Table 36.

TABLE 36
REASON FOR LEAVING IOWA

	52	100	21	100	14	100	87	100

Factors Influencing Employment Status

This group's picture of employment as practical nurses has also changed since the time of the PNS data collection in 1965 when the subjects of this sub-study were shown to be either unemployed or out-of-state and not contributing to practical nursing in Iowa at that time.

Of the CIED group 29% have returned to practical nursing, 10% full-time and 19% part-time; 12% are employed in health-related and other kinds of occupations, and 59% remain unemployed.

Of the COED group, 33% are now practicing practical nursing full-time, five percent are employed full-time in a health-related and 14% full-time in non-health related occupations. Forty-eight percent remain unemployed.

Of the IIED group, 23% are now employed as practical nurses, eight percent full-time and 15% part-time. One of the subjects became educated in professional nursing and is practicing full-time as a registered professional nurse. Seventy-seven percent remain unemployed.

Since one is now a full-time professional nurse, there are 86 remaining practical nurse subjects in this sub-study. Of these 86, 30% have returned to practical nursing, 16% full-time and 14% part-time; three percent are employed full-time in other health related fields, eight percent in non-health related fields and 59% remain unemployed. Therefore, 70% are not employed as practical nurses. See Table 37.

TABLE 37
PRESENT EMPLOYMENT STATUS

PRESENT	CIED		COED		IIED		TOTAL	
EMPLOYMENT STATUS	N	%	N	%	N	%	N	%
LPN Full-Time	5	10	7	33	1	8	13	16
LPN Part-Time	10	19	-	-	2	15	12	14
Other Health Full-Time	2	4	1	5	-	-	3	3
Non-Health Full-Time	1	2	3	14	-	-	4	5
Non-Health Part-Time	3	6	-	-	-	-	3	3
Unemployed	31	59	10	48	10	77	51	59
	52	100	21	100	13	100	86	100

Of those presently employed, 49% are employed in general hospitals, three percent in psychiatric hospitals, nine percent in nursing homes and 11% in doctors' offices. Twenty-eight percent reported present employment in non-health institutions. See Table 38.

TABLE 38
EMPLOYMENT LOCATIONS OF SUBJECTS PRESENTLY EMPLOYED

	CIED		COED		IIED		TOTAL	
EMPLOYER	N	%	N	%	N	%	N	%
General Hospital	13	62	3	27	1	33	17	49
Psych. Hospital	1	5	-	-	-	-	1	3
Nursing Home	1	5	1	9	1	34	3	9
Doctors' Office	-	-	3	27	1	33	4	11
Other	6	28	4	37	-	-	10	28
	21	100	11	100	3	100	35	100

Note: Thirty-one in the CIED group, and 10 in each of the COED and IIED groups reported being presently unemployed (Table 37). Therefore, no present employment location was identified by these 51 respondents.

Of the 61 presently not employed as practical nurses, 69% reported family responsibilities as the primary reason for not working and 11% gave this as the secondary reason. Eight percent reported their primary reason is that their husbands do not wish them to work and 26% gave this as the secondary reason. Six percent gave low LPN salary as the primary reason and 20% gave this as the secondary reason. See Table 39.

TABLE 39
PRIMARY AND SECONDARY REASONS FOR UNEMPLOYMENT AS A PRACTICAL NURSE

	CIED				COED				IIED				TOTAL			
	Pri.		Sec.		Pri.		Sec.		Pri.		Sec.		Pri.		Sec.	
REASON	N	%	N	%	N	%	N	%	N	%	N	%	N	%	N	%
Personal Heal.	1	3	-	-	1	7	-	-	1	10	1	10	3	5	1	2

Husband Does-Not Want Me To Work	4	11	9	24	1	7	2	14	-	-	5	50	5	8	16	26
LPN Salary Not Adequate	3	8	9	24	1	7	3	22	-	-	-	-	4	6	12	20
Distance From Home	1	3	3	8	-	-	1	7	-	-	1	10	1	2	5	8
Feel Not Accepted As LPN	1	3	1	3	-	-	-	-	-	-	-	-	1	2	1	2
Unable To Work Shift Avail.	-	-	1	3	-	-	-	-	-	-	-	-	-	-	1	2
Other	-	-	2	5	2	14	-	-	-	-	-	-	2	3	2	3
No Response	2	5	7	19	1	7	6	43	-	-	3	30	3	5	16	26
	37	100	37	100	14	100	14	100	10	100	10	100	61	100	61	100

Of the two indicating "other" as the primary reason, they stated:

(1) "I would need to acquire licensure in Illinois so am now working full-time as a secretary", and

(2) "I recently returned to Iowa from Illinois and have not yet renewed my license".

The three "other" given as secondary reasons are:

(1) "Am self-employed. I own and operate a hotel",

(2) "Am a full-time airline stewardess", and

(3) "I am not working as a LPN because my employer will permit me to function only as a nurse aide".

All 14% who are now employed as part-time practical nurses and gave addresses in Iowa (See Table 37) indicate they plan this employment status to continue. See Table 40.

TABLE 40

12		

Future Employment Plans

Fifty-seven percent reported the primary reason they would consider returning to employment is a change in family responsibilities. Thirteen percent gave this as the secondary reason. Sixteen percent reported supplementing of family income to be their primary reason; and 26% gave this as the secondary reason. Seven percent gave increase in LPN salary as the primary reason and 24% gave it as the secondary reason. See Table 41.

TABLE 41
PRIMARY AND SECONDARY REASONS FOR POTENTIAL RETURN TO EMPLOYMENT AS A PRACTICAL NURSE

	CIED				COED				IIED				TOTAL			
	Pri.		Sec.		Pri.		Sec.		Pri.		Sec.		Pri		Sec.

Increase in LPN Salary	4	11	8	22	-	-	5	35	-	-	2	20	4	7	15	24
Improved Working Relations With Nsg. Person.	1	3	1	3	-	-	-	-	-	-	-	-	1	2	1	2
Other	-	-	1	3	-	-	-	-	-	-	-	-	-	-	1	2
No Resp.	2	5	3	8	2	14	4	29	1	10	2	20	5	8	9	15
	37	100	37	100	14	100	14	100	10	100	10	100	61	100	61	100

The one subject giving "other" as the primary reason is retired with two children over 30 years of age but reported she would return to practical nursing in an emergency such as a major disaster or war.

Of the number not employed as practical nurses, 73% plan to return to practical nursing and 23% plan no future employment. Two percent will return to work but not as practical nurses, two percent are undecided. See Table 42.

TABLE 42
PRESENTLY UNEMPLOYED LPNS' PLANS FOR FUTURE EMPLOYMENT

	CIED		COED		IIED		TOTAL	
	N	%	N	%	N	%	N	%
Do Not Plan to Work	6	19	3	25	3	33	12	23
Return to Prac. Nsg.	25	81	9	75	4	45	38	73
Return But Not to Prac. Nsg.	-	-	-	-	1	11	1	2
Undecided	-	-	-	-	1	11	1	2
	31	100	12	100	9	100	52	100

Note: Six in the CIED group, two in the COED group and one in the IIED group did not respond to this item.

This data shows that the group still unemployed as practical nurses should not be considered consistently and permanently out of the practical nurse work force.

CHAPTER IV

SUMMARY AND CONCLUSIONS

This study concerns practical nurses who have been licensed in Iowa but are not presently employed as practical nurses in Iowa. The purpose was to determine: social and educational characteristics, their reasons for present unemployment and their plans for future employment as practical nurses in this State.

All of the subjects are women and the majority came from a rural background. Predominately, their fathers were farmers, their mothers were not employed outside the home, and they had from two to five siblings.

On an average, they attained a higher level of education than their parents but none had completed a baccalaureate degree.

Over one-half made their decisions to become practical nurses between the ages of 15 and 19 and first became acquainted with their preparatory program through mass media, particularly newspapers.

A large percentage of the group held at least one job before becoming licensed practical nurses and these jobs were primarily in health-related occupations.

During enrollment in nursing programs, the majority were financially supported by parents and relatives and a minority worked part-time to help finance their nursing education.

Slightly over one-third of the subjects were licensed as practical nurses on the basis of having attended a program in professional nursing.

In 1965, one-fifth of the group were 19 years of age and by far the greatest number were between 20 and 29. Few were over 55.

Eigty-five percent have been married at least three years. Three-fourths of the subjects have children and nearly one-half of these others have children who are all under six years of age.

Geographic mobility of practical nurses from place of birth to the location of their nursing preparatory program and between jobs since licensure is relatively low. They tended to go to nursing education programs and to have been employed as nurses near their home communities.

For the majority, past employment has been in general hospitals. In decreasing order of frequency, the remainder were employed in doctors' offices, nursing homes and psychiatric hospitals.

The vast majority of practical nurses ever licensed in Iowa continue to live in Iowa. Among those who do move out-of-state, "marriage" is given as the predominant reason.

In late 1965 these subjects indicated they were not employed as practical nurses in Iowa. Six months later, when the data were collected for this study, about one-third of the group had returned to practical nursing in this State.

For those who continue not to be employed as practical nurses in Iowa, it appears there is little that outside sources can do to facilitate their return to employment at this time. Among reasons given for their present unemployment, "family responsibilities" far excels any other. The great majority also indicated their return to work hinges on this same factor but that as their children mature in age and family responsibilities lessen, they plan to return to employment as practical nurses. Salaries do not seem to be a major factor in their decision to return. Very few indicated they definitely do not plan to return to practical nursing in the future.

Marriage, with its accompanying potential mobility, and motherhood, with its accompanying responsibilities, will no doubt continue to influence the

number of unemployed practical nurses. Many, however, will eventually return to active practice in this field. This cycle will unquestionably continue among practical nurses in Iowa.

The great majority are neither consistently nor permanently out of the practical nurse work force. Rather, they have been a comparatively stable group of workers to date. Over time, however, the aging process will demand prepared nurses for necessary replacements. Added to the present need for more available nursing service personnel in Iowa, a need which will continue and grow in the future, it is evident that the educational preparation of nurses for Iowa must be augmented.

CHAPTER V

RECOMMENDATIONS

The conclusions result in the following recommendations for Iowa:

1. that nurses for all fields of nursing be prepared in larger numbers,
2. that these nurses be prepared in approved educational programs in professional nursing, technical nursing, and practical nursing,
3. that applicants to these programs be better informed of the available types of educational preparation for nursing so that each can more effectively select the type of program for which his abilities and motivation are best suited,
4. that nursing education programs in Iowa be expanded in size and/or increased in number to provide additional available nursing personnel, and
5. that these programs be expanded in size and increased in number <u>only</u> when and where quality educational programs are assured.

PRACTICAL NURSING STUDY

(A Prospectus)

The research and evaluation described herein is being performed pursuant to a contract with the United States Department of Health, Education, and Welfare, Office of Education

Supported by:
Division of Vocational and Technical Education
United States Office of Education
Department of Health, Education, and Welfare
Contract No. 5-85-038

FOREWORD

This is a Prospectus of a study supported by the United States Department of Health, Education, and Welfare, Office of Education. The research project is the responsibility of the University of Illinois, College of Education, with cooperation from the University of Iowa, Programs in Health Occupations Education. Some members of the research staff will have a background and experience in nursing education and nursing service.

An advisory committee representing professional associations and agencies will be utilized for guidance and consultation.

This study is concerned with determining the nature of the population of licensed practical nurses, their employment patterns and preferences, the recruitment and selection of students of practical nursing and the programs through which they are prepared, as well as the relationships among identifiable characteristics of individuals and their employment patterns as practitioners of practical nursing. It will include individuals, programs, and employment settings in the states of Illinois and Iowa.

All data collected will be held in strict confidence by the professional research staff. Upon completion of the study, the final report will be made available to all participating programs, agencies, and organizations. No individual or specific institution or agency will be identified by name in the reports.

Robert M. Tomlinson, Director

INTRODUCTION

The health occupations field is one of the most rapidly expanding areas in terms of demand for technical advancement and personnel. Despite the accelerated development of nursing programs and the attempts to augment the recruitment of personnel to meet past and present nursing needs, a critical shortage continues to exist in both quantity and quality at all levels of nursing. The increase in population and the growing need for services exceeds the increase in educational programs and student enrollment in programs. A restructuring of the knowledges, skills, and functions of traditional nursing patterns is also taking place.

One of the greatest single changes is the emerging role of the prepared, licensed practical nurse as a member of the nursing team. It is only in relatively recent times that programs of practical nurse education are reaching a level of maturity and stability of operation.

PURPOSES OF THE STUDY

The long-range goal of the study is the improvement of the nursing services through the improvement of the selection process, educational programs (including curriculum and the instructional staff) and better utilization of prepared personnel. This study will not attempt to implement changes, but will provide new knowledge and relationships in a meaningful manner that may be applied by those directly responsible for preparing practical nurses and utilizing their services.

The general hypothesis of the study is that there exist differential and identifiable characteristics among potential and actual students in approved programs of practical nursing, the programs themselves and the employment situations, and that meaningful relationships among these characteristics can be determined. Findings from an investigation of these characteristics and the relationships among them should serve to improve the quantity and quality of available nursing services.

DEFINITIONS

(1) ***The practice of practical nursing:*** The performance for

compensation of selected acts in the care of the ill, injured, or infirm under the direction of a registered professional nurse or a licensed physician or a licensed dentist; and not requiring the substantial specialized skill, judgment and knowledge required in professional nursing.[1]

(2) ***The Role of the Licensed Practical Nurse:*** The work of the LPN is an integral part of nursing. The licensed practical nurse gives nursing care under the supervision of the registered professional nurse or physician to patients in simple nursing situations. In more complex situations, the licensed practical nurse functions as an assistant to the registered professional nurse.[2]

(3) ***The Licensed Practical Nurse (LPN):*** The occupation of practical nursing has developed in recent years to the place where all states legally provide for practical nurse licensure. The procedures and requirements for obtaining a license to practice as a practical nurse were established by statutes in Iowa in 1949 and Illinois in 1951.

A total of 13,744 licenses had been issued to practical nurses in Illinois and 3,976 issued in Iowa at the end of July 1965.

Particular attention will be given to those LPN's who have attended an approved nursing education program and have met the licensure requirements of Illinois or Iowa.

CONDUCT OF THE STUDY

This study consists of three interrelated phases which are scheduled over a 39-month period. The research group will be structured to work concurrently in Illinois and Iowa during each phase of the study.

[1]National League for Nursing, *Licensed Practical Nurses In Nursing Services*, 10 Columbus Circle, New York, p. 39.

[2]Statement jointly approved by the American Nurses' Association and National Federation of Licensed Practical Nurses, 1964.

The universe of the possible employment locations for cooperation in the interviews will be established by contacting a sample of all currently licensed practical nurses in each of the two states. In addition all practical nurse education programs, public and private, will be contacted as possible participants.

Directories from the governmental agencies and professional associations will also be used to validate the sample.

PHASE I. – September 1965 to September 1966:

Objective – to identify the knowledges, functions, and occupational patterns of a selected sample of practical nurses who are licensed on the basis of having attended an approved nursing education program.

A random sample of approximately 550 practical nurses and 250 supervisors of practical nurses will be selected for a personal interview. Where possible, it is desirable to conduct the interviews at the employment locations. The study is designed to include representatives from all types of employment situations and assignments. The sample is structured to retain this representation without overburdening the cooperating employment agencies. To avoid prejudicing the study, the interviewees should be randomly selected from LPN's employed at the location.

PHASE II. – January 1966 to February 1968:

Objectives – (1) to determine the characteristics of all applicants, students, and graduates of selected programs of practical nursing and their relationships, and

(2) to determine the characteristics of a selected sample of programs of practical nursing, to identify those criteria related to student success, and occupational patterns of graduates.

The cooperation of at least thirty practical nurse education programs with a total enrollment of approximately 1,000 students will be solicited. The sample will include programs representing differences in size, administrative structure, educational personnel, curriculum organization, facilities, and community.

This phase will be concerned with all applicants for and students enrolled in the cooperating programs in the September 1966 and February 1967 classes.

The cooperating programs will be provided, from the National League for Nursing and other sources, with standardized tests and other special instruments for use in student selection and evaluation. Study personnel will visit the programs for additional data collection sessions, e.g., testing, interview, etc. All expenses for the tests and their scoring will be paid by the research project and the results made available to the program concerned.

The testing and visitation sessions will be cooperatively pre-scheduled and planned so as to require minimal alterations in schedules and activities. Three data collection sessions of less than one day each will be necessary during the enrollment of the class.

PHASE III. – January 1968 to July 1968:

Objective: to follow-up the applicants, dropouts, and graduates of the selected programs to determine relationships between the characteristics of the individuals, programs attended, and employment situations.

Starting about four months after graduation of the classes studied, a random sample of approximately 500 applicants, dropouts, and graduates will be contacted for a follow-up personal interview; the remainder will receive a mail questionnaire.

All data and previous findings will be applied to the follow-up of the new graduates in the employment situation to gain insights into the intercorrelations of personal characteristics, educational programs, employment situations, and occupational information and patterns.

This should result in the identification of discriminating selection criteria which tend to predict success in practical nurse programs and in employment.

NOTE: Not included in this research project but anticipated for possible future approval is a four-year follow-up study of the graduates and programs studied in Phases II and III. The instruments and findings of these earlier phases would be utilized to investigate relationships between characteristics of the individuals, programs, and employment situations over a time period.

THE DATA COLLECTION

The material to be collected from both the interviews and from the educational programs is dictated to a large degree by the factors that are assumed to have an influence on the individuals' educational and occupational choices and patterns and their responses. Consequently, a job history will be solicited from each interviewee which will then be assessed to determine if there are identifiable patterns such as: assignment of duties across or among employment locations, stability and mobility of assignment within and/or between employers and geographic locations, movement into and out of employment as a practical nurse.

A group of cards has been developed to represent a broad sampling of possible functions or activities that may be performed by a practical nurse. Each card has a single brief statement of an activity on it. The interviewee will be asked to indicate those activities she performs as a part of her duties.

The interview sheet was designed to identify (1) the formal educational background, (2) the nature of the education, (3) the place and persons involved in developing an interest in practical nursing, and (4) the occupational history.

THE DATA ANALYSIS

The use of standardized instruments whenever possible will facilitate interpretation and utilization of results by others. Computer programs and analyses have been developed by both the University of Illinois and the University of Iowa in conjunction with studies of technicians and Specialty Oriented Students. Many of these will be applied and/or adapted for use in this study.

The IBM 7094 computer facility at the University of Illinois will be utilized, wherever possible, in the analysis of the data.

THE UNIVERSITY OF IOWA

Program in Health Occupations Education
OFFICE OF:
Director
Program in Health Occupations Education
and
State Consultant
Health Occupations Education
Division of Vocational Education
Department of Public Instruction

July 8, 1966

Dear

The University of Iowa Program in Health Occupations Education, in cooperation with the Iowa Department of Public Instruction, is conducting a study of practical nurses who are, or have been, licensed to practice in Iowa.

The primary purpose is to determine work patterns of licensed practical nurses and we can only do this by obtaining accurate information directly from licensed practical nurses themselves. Because a study of all licensees would be prohibitive time-wise, a random sample method is being utilized.

You have been selected to represent a group of licensed practical nurses and we solicit your cooperation to help us complete this study. All information will be treated as strictly confidential and nowhere in the report of the study will you be identified either by name or license number.

We will be indeed appreciative if you will thoughtfully fill out the enclosed questionnaire and return it to us as early as possible but no later than August 8, 1966, so that the study may be completed on schedule. A stamped return envelope is provided.

Thank you for your time and cooperation. When individuals respond to such a request as this, they make a real contribution to the future progress of practical nursing.

Sincerely,

Elizabeth E. Kerr

IMMEDIATE REPLY REQUESTED

IOWA PRACTICAL NURSE SUB-STUDY

Questionnaire

Name_____
Address_____
_____
License Number_____

PERSONAL AND FAMILY DATA

1. Size of town in which you were born.

__Rural
__Less than 2,500 people
__At least 2,500 but less than 5,000
__At least 5,000 but less than 10,000
__At least 10,000 but less than 20,000
__At least 20,000 but less than 50,000
__Larger than 50,000

2. Distance of town where you now live from town where born.

__It is the same town
__Less than 25 miles
__25-50 miles
__50-100 miles
__100-200 miles
__More than 200 miles

3. If you are living in a state other than Iowa or employed in another state, please give reason(s) for leaving Iowa.

4. Please list brothers and sisters and state whether they are older or younger than you.

5. Father's occupation._____

6. Circle the highest grade completed by father in education.

Elementary	Junior High	High School	College
1 2 3 4 5 6	7 8 9	10 11 12	1 2 3 4 more

7. Mother's occupation._____

8. Circle the highest grade completed by mother in education.

Elementary	Junior High	High School	College
1 2 3 4 5 6	7 8 9	10 11 12	1 2 3 4 more

9. What is your marital status? (Please check the one which applies to you and fill in the year that status was acquired.)

__single
__married 19__
__separated 19__
__widowed 19__
__divorced 19__
__married to church 19__

10. Give the ages of your children.

EDUCATIONAL EXPERIENCE

1. Circle the highest grade you completed.

Junior High	High School	Post High School
7 8 9	10 11 12	1 2 3 4 more

2. List the types of formal education you have had beyond high school.

3. Did you work while you were attending practical nursing school?__Yes__No

4. Who provided the money to pay for your practical nurse education?

_____

5. How did you first find out about the school of practical nursing that you attended?

6. At what age did you decide you wanted to be a licensed practical nurse?

7. Distance of town where you now live from where you went to practical nursing school.

__It is the same town
__Less than 25 miles
__25-50 miles
__50-100 miles
__100-200 miles
__More than 200 miles

EMPLOYMENT INFORMATION

1. Work done before being licensed as a practical nurse. (Check more than one if necessary to describe your situation.)
__Never worked before
__Aide, orderly or attendant in health setting
__Job in health setting other than aide, orderly or attendant
__Job unrelated to health field

2. Number of different jobs held before becoming a L.P.N._____.

3. Number of years you worked before you became a L.P.N._____.

4. Year first employed as L.P.N._____.

5. Number of years you have worked as a L.P.N._____.

6. Number of different jobs you have had as a L.P.N._____.

7. Total number of jobs held in your life time_____.

8. Are you now working? Yes__No__

   As a L.P.N.__ Full-time__ Part-time__
   Other kind of job (Please State)_____
   Full-time__ Part-time__

9. If you are working, how long do you plan to work as a L.P.N.?_____
   Or work at some other job?_____

10. Where do you work? (If you are not working please mark this question for your last job.)

    __Hospital
    __Doctor's Office
    __Other (Please State)_____
    __Nursing Home
    __Public Health

11. If you are not working -

    Do you plan to return to work? Yes__No__
    As a L.P.N.? Yes__No__
    Doing some other kind of work (Please state what)_____
    When do you plan to return to work?_____

12. Number 1, 2, 3 the reasons that best describe you and your situation. "I am not working as a Licensed Practical Nurse because:"

    __Distance to L.P.N. job too far.
    __Did not feel accepted by nursing personnel.
    __Personal health reasons.
    __Family and home responsibilities.
    __Low salary.
    __My husband does not want me to work.
    __Other reason (Please State)_____

13. Number 1, 2, 3 the reasons that would have the greatest influence on your decision to return to work as a L.P.N. (If you have returned to work or are working number 1, 2, 3 the reasons that best describe why you are working.)

    __L.P.N. salary increased.
    __Change in family responsibilities
    __Desire for contacts outside the home.
    __To supplement family income.

13. continued:

__Improved working relations with nursing personnel.
__Enjoy working.
__Other (Please State)_____

14. For the period of time from June 1, 1961 to date, please list the types of jobs you have held and the length of time you worked at each job.

NOTE:

IF YOU HAVE ANY QUESTIONS ABOUT THIS QUESTIONNAIRE OR THE STUDY, YOU MAY CALL THE STUDY OFFICE COLLECT BETWEEN 8:00 a.m. and 5:00 p.m. TELEPHONE AREA 319-353-3536.

July 22, 1966

Dear

The study of practical nurses who are, or have been licensed to practice in Iowa conducted by The University of Iowa Program in Health Occupations Education in cooperation with the Iowa Department of Public Instruction is progressing well. We have heard from most of the group of practical nurses selected to represent the practical nurses of Iowa.

This study would be much more accurate and complete if we could hear from you. July 8, 1966 we mailed you a questionnaire, but just in case it got lost or mislayed we are mailing you a duplicate copy. It would be of great value to practical nursing if you will thoughtfully fill out the enclosed questionnaire and return it to us immediately. A stamped return envelope is provided.

Thank you for your time and cooperation. As our first letter indicated the purpose of this study is to find out work patterns of licensed practical nurses. We can do this only if you provide us with information.

Sincerely yours,

INTRODUCTION

It is the purpose of the MASTER PLAN CONCEPT FOR CAREER DEVELOPMENT EDUCATION to serve as a nation-wide guide which is systematically and cooperatively developed by a consortia of educational leaders.

The focus of the MASTER PLAN shall be to provide a sequential order for CAREER DEVELOPMENT EDUCATION that emphasizes flexibility for content and articulation through grade level structure.

The plan is predicated on a continuous developmental process which accomodates present needs through a planned reorganization process and directs its long-range goal on coordinating all facets of the learning process for CAREER DEVELOPMENT EDUCATION as it affects the learner; namely:

CURRICULUM
PERSONNEL
GUIDANCE
FACILITIES
COMMUNICATIONS

The identification and organization for the MASTER PLAN CONCEPT is an outgrowth of the follow-up conducted as part of the Vocational Education Project of the Great Cities Research Council.

In addition to the individual city visitations made as a part of the follow-up procedure, a series of three regional follow-up conferences were held in the East, Midwest, and on the West Coast. A copy of the agenda to which each of these conferences were addressed may be found in APPENDIX A.

The graphic analysis illustrated on the following pages depicts an organizational plan necessary to support the MASTER PLAN CONCEPT in three categories:

DEVELOPMENTAL
FUNCTIONAL
OPERATIONAL

The cooperative efforts of the school administrators represented in the organizational plan as the Advisory Panel and the educators that function on the Steering Committee and the Program Planning Sub-Groups are supported by resource personnel who will foster a concise plan to be considered for implementation in each respective school system.

The Great Cities Research Council will continuously assist this undertaking through its project staff as needed for coordination and communication.

The MASTER PLAN CONCEPT is not proposed as a "cure-all" for education but merely as a rationale which may be applicable to our American educational system.

The outgrowth of this endeavor may serve as a vehicle for achieving the type of continuity and direction that coincides with the changes mandated by the influence of our cultural pattern and the educators' desire to accomodate all individuals and all ages in the learning process.

Finally, the MASTER PLAN CONCEPT may serve as a basis for bringing about the desirable goals and aspirations which educators commonly seek to implement in their educational programs that embrace career development for all students. Through a concerted effort of positive sharing in the program planning for CAREER DEVELOPMENT EDUCATION the total program may be enhanced.

EASTERN REGIONAL FOLLOW-UP CONFERENCE

AGENDA

DATE:	Wednesday, November 2, 1966
PLACE:	Room 514 131 Livingston Street Brooklyn, New York
TOPIC:	Feasibility of a cooperative action program compatible with a master plan concept.
GOAL:	An acceptable procedure for coordinate action
	SESSION CHAIRMAN: Donald M. Brill
10:00 AM	Background, setting and introductions
10:45 AM	Review of master plan concept: George J. Fuka
12:00 noon	Lunch Break
1:30 PM	Open discussion--DISCUSSION LEADER: George J. Fuka Identification of City Projects
4:00 PM	Adjourn

WESTERN REGIONAL FOLLOW-UP CONFERENCE

AGENDA

SUBJECT: Two-day Curriculum Project Follow-up Meeting

DATE AND PLACE: November 9 and 10, 1966
El Cortez Hotel
San Diego, California

TOPIC: Feasibility of undertaking a cooperative curriculum demonstration project that is compatible with a master plan for career development education.

GOAL: To develop a Curriculum Research Project compatible with the master plan concept.

WEDNESDAY, NOVEMBER 9, 1966

10:00 AM	City representatives convene over coffee. Welcome: Mr. Donald M. Brill, Vocational Coordinator, Research Council Introduction of participants
10:30 AM	Statement of session procedure and review of developments to date. Review of a master plan concept. Discussion Leader: Mr. George Fuka, Research Associate, Research Council
11:00 AM	Open discussion and suggestions relative to feasibility of proposal development. Emphasis will be placed on enumerating details for incorporation into the master plan concept, a curriculum proposal, and the identification of rationale to support it. Ideas will be listed on a blackboard for group discussion.
12:00 noon	Lunch Break
1:30 PM	Reconvene to identify possible approaches to a curriculum project. Suggested formats for above: Los Angeles San Francisco San Diego

THURSDAY, NOVEMBER 10, 1966

9:00 AM	Review and evaluate possible approaches for a cooperative curriculum project and identify individual city involvement. Recommendations by representatives of California's Industry-Education Council and agency representatives. Summary remarks
12:30 PM	Lunch and closing remarks

Storrs, Connecticut 06268

A subcontract of

Contract No. OE-5-85-112

The research reported herein was pursuant to a contract with the Office of Education, U. S. Department of Health, Education, and Welfare in cooperation with Connecticut State Department of Education, Division of Vocational Education. Contractors undertaking such projects under government sponsorship are encouraged to freely express their professional judgment in the conduct of the project. Points of view or opinions stated do not, therefore, necessarily represent official Office of Education position or policy.

The Complete Report of This Study is Available in Limited Quantities from the State Department of Education, State Office Building, Hartford Connecticut. Single Copies Will be Provided Free of Charge.

U.S. DEPARTMENT OF HEALTH, EDUCATION & WELFARE
OFFICE OF EDUCATION

THIS DOCUMENT HAS BEEN REPRODUCED EXACTLY AS RECEIVED FROM THE PERSON OR ORGANIZATION ORIGINATING IT. POINTS OF VIEW OR OPINIONS STATED DO NOT NECESSARILY REPRESENT OFFICIAL OFFICE OF EDUCATION POSITION OR POLICY.

ACKNOWLEDGEMENT

This project was supported by a contract from the Division of Vocational Education, Connecticut State Department of Education in cooperation with the U. S. Office of Education.

Special appreciation is expressed to Dr. Philip Masley, Consultant in Research, Connecticut State Department of Education for his guidance throughout the development of this experimental curriculum guide.

Appreciation is also expressed to the advisory panel for their suggestions, critique and reference data they have provided. The advisory panel personnel for this project are as follows:

Name	Representing
Mr. Philip Larkin	The Great Atlantic and Pacific Tea Company
Mr. Robert Collins	Stop & Shop, Incorporated
Mr. Joseph O'Connor	First National Stores, Incorporated
Mr. Peter Quinn	First National Stores, Incorporated
Mr. Fred Yeager	Mott's Supermarkets, Incorporated
Mr. Richard Bozzuto	Bozzuto's, Incorporated
Dr. Philip Masley	Connecticut State Department of Education
Mr. Llewellyn Turner	Connecticut State Department of Education
Mr. Jesse Taft	U.S. Office of Education Northeastern Regional Representative
Dr. Theodore Leed	University of Massachusetts
Prof. Robert L. Bull	University of Delaware
Dr. W. Howard Martin	University of Connecticut
Dr. Philip G. Stiles	University of Connecticut
Miss Ruth Cowles	Connecticut State Department of Education
Mrs. Helen O'Donnell	Connecticut State Department of Education
Mr. Daniel A. Digiulio	Glastonbury High School

Additional appreciation is given to the many University of Connecticut staff members who contributed toward the development of this curriculum guide. Particular thanks are noted to Mrs. Kathleen Fortier and Mrs. Lucy Krueger for their secretarial skills, Mr. Peter Moon for his drafting and Mr. Don Lu for his data analyses.

39

FOREWORD

Americans enjoy the most abundant and varied food supply at the lowest relative cost of any people in the world. This high standard of living has been made possible by the work of Land-Grant colleges and universities, vocational programs and other educational efforts.

A glance at the modern food store tells us that a wealth of planning, ingenuity, and skill are necessary to keep today's many food products flowing smoothly into consumer hands. However, little emphasis has been given to education aimed at more effective and efficient distribution of food.

Today, there is a shortage of well-trained people in the food handling and distribution industries. While automation and pre-packaged convenience foods have replaced some traditional skills, new and more demanding positions grow and grow. The industry especially will continue to face an acute shortage of managerial talent--people to fill positions as store managers, supervisors and other administrative jobs.

These people must be well-trained in order to cope with the many problems encountered in food handling and distribution. No longer is on-the-job training of noncareer-oriented high school graduates deemed adequate to carry out these responsibilities effectively.

The food industry is finding that vocational training at high school or post-high school levels is of value to youths entering their employ. It is also advantageous in youths' search for higher starting wages, more attractive positions and their understanding of the job he seeks.

Stability and security are the hallmarks of the food industry. Its opportunities for advancement and growth potential are equal or even superior to many other occupations. Numerous satisfying, well-paid jobs exist at all levels, and the opportunity is great for frequent advancement of well-trained individuals.

Young men and women with an interest in this field should begin to receive training at the high school level and then carry on continually with each new challenge. School and college faculties must meet this obligation with new and updated teacher programs oriented to needs. Improved career opportunities can be developed in this field through coordinated efforts by educational institutions, government agencies and commercial organizations.

Introduction

Demands for more education, both specialized and general, characterize employment requirements in many industries.[1] Additional education is valued in terms of advancing efficiency. It is also recognized as a principal means by which individuals can attain their economic and social aspirations in a technological world.

The Food Industry including producers, processors, wholesalers, and retailers is the largest industry in America. The retail value of food consumed was $80 billion in 1964, representing 20 percent of personal consumption expenditures.[2]

Employment in food handling and distribution in 1965 included: (1) Food retailing, 1,419,900 and (2) Food wholesaling, 494,600. Approximately 23,600 persons are employed in food handling and distribution in Connecticut.

This study centers on education of employees in one phase of the food industry. It presents data on employment opportunities and educational requirements in food handling and distribution for Connecticut. These data are related to current programs of education in vocational, secondary, and post-secondary schools.

The major purpose of this study was to develop an experimental curriculum guide for training persons at the high school and post-high school levels in food handling and distribution. As a basis for the curriculum guide, secondary purposes of the study were established as follows:

1. To define the needs for vocational programs in food handling and distribution in reference to preemployment and in-service training.

2. To define the level and type of training needed by students and the special preparation needed by teachers and administrators in their programs.

3. To describe and analyze current programs and courses in food handling and distribution.

Data were gathered on a sample basis by personal interviews with food store managers and personnel under their supervision and others whose training and/or experience warranted inclusion. A total of 611 persons were interviewed.

---

1 "Doing Their Homework," Barron's, January 2, 1967, page 11.

2 Monthly Labor Review, 1966, 89:6:703, Bureau of Labor Statistics, United States Department of Labor.

Data relative to present and future full-time and part-time employment opportunities in Connecticut were gathered from correspondence with food chain stores and review of research of off-farm agricultural occupations.

Employees in Food Stores

The age of food store personnel interviewed ranged from 19 to 72 with a mean age of 36.6 years. The mean age for managers was 39.5, 50.6 for owner-managers and 28.9 for assistant managers.

Years of formal schooling for all food store personnel averaged 11.5 years; somewhat less than a high school education. Managers and assistant managers averaged 12.1 years while owner-managers averaged 10.5 years formal schooling.

Table 1 -- Average Age and Years Formal Schooling of Food Store Personnel by Job Title

Job Title	Average Age: Years	Average Years Formal Schooling
Managers, Owner-Managers, Assistant Managers	39.6	11.8
Grocery Managers, Assistant Grocery Managers	29.7	12.1
Meat Managers, Assistant Meat Managers	41.5	11.4
Produce Managers, Assistant Produce Managers	37.7	11.3
Bakery, Delicatessan, Frozen Foods or Dairy Managers and Assistant Managers	34.0	11.6
Meat Cutters	36.8	10.4
Clerks, Stockboys, Checkers	31.0	11.4
Cashiers, Bookkeepers	31.2	12.0
Average	36.6	11.5

The two tables that follow deal with levels of education and work experiences of present food store managers. Approximately 80 percent of all managers interviewed in this survey were high school graduates; 27 percent of this same group having pursued higher levels of education.

Table 2 -- Formal Schooling Completed by Food Store Managers.

Job Title	Less Than High School	Some High School	High School Diploma	Some College	College Degree
			Percent of Total		
Food Store Managers	9.7	9.7	53.7	22.6	4.3

Over 88 percent of Connecticut's food store managers were employed on a part-time basis while attending high school. Ninety percent of this total were employed by food stores, the majority as clerks. In line with this finding, food store personnel and teachers voiced strong support in favor of some type of work experience whether it be placement for food training experience before graduation or on-the-job training after graduation.

Analysis of part-time employment characteristics for the 25 managers and owner-managers who continued their formal schooling beyond high school showed that only 26 percent of the total worked part-time while attending post-high school educational institutions, three worked for food stores.

Data presented in Table 3 show that of the managers and owner-managers who did not continue their formal education beyond high school, 52.5 percent followed a general curriculum. Of the managers and owner-managers who continued their education beyond high school, 44 percent followed a college preparatory curriculum.

Table 3 -- High School Curricula of Managers and Owner-Managers.

Curriculum	9 to 12 Years Formal Schooling Percent of Total	12 Years Formal Schooling Percent of Total
General	52.5	4.0
Commercial	16.9	24.0
College Preparatory	13.6	44.0
Business	11.9	20.0
Technical-Agriculture	5.1	8.0
Total	100.0	100.0

Educational Needs of Food Store Personnel

From the firm's viewpoint, volume of sales per worker is an important measure. Education before or after employment, which can improve this efficiency factor, merits consideration. Good wages and opportunities for advancement in employment make it worthwhile for prospective and current employees to make special efforts to attain education. The extent to which these propositions relative to the firm and individual are true for food handling and distribution are not well established. However, the efforts of the industry to develop training materials and programs support the beliefs. Also, both public and private institutions offer programs or materials designed to serve persons who have entered or who are preparing to enter food handling and distribution.

As in other significant enterprises, it seems evident that a variety of educational programs are needed. This variation is needed to serve persons having different levels of ability and aspirations. It is needed in terms of job specialization (i.e. meat cutters vs. cashiers).

The nature of these programs suggest three broad areas of educational needs: (1) knowledge of foods and food products (technical), (2) salesmanship, and (3) marketing and management. In traditional programs of vocational education these three areas generally are found in three or more instructional areas: (1) agricultural or home

economics (biological science) /knowledge/, (2) distributive education /salesmanship/, and (3) business and economics /marketing and management/. It is recognized by vocational educators that this compartmentalization of offerings requires a new look in terms of many new occupations which cut across them.

In lieu of the job analysis approach in developing occupational courses, that is, making an exhaustive list of manipulative and cognitive activities persons perform while working, food store personnel and others were asked to identify and rate subject matter areas functioning in food store management positions. This latter consideration is important with regard to the relative importance of subject matter. Meat handling and cutting for example, would vary, depending upon whether vocational preparation was for meat cutters or food store managers.

An explanation of Table 4 is necessary in order that one may accurately interpret the data. Respondents were asked to indicate what kind of courses or subjects they felt would have been most helpful in their work. Their responses were classified under five subject matter areas, namely, Interpersonal Relations and Communications (communicative skills and human relations); Business and Management (business, bookkeeping and accounting); Commodity Handling and Distribution (marketing, merchandising, and mathematics); Product Knowledge; and other areas.

Table 4 presents a summary of opinions of respondents to the desirability of the five previously defined subject matter areas in their own preparation for food store positions. Sixty-six percent of the total group indicated that courses in commodity handling and distribution would have been helpful. A frequency tally of the 14 percent registered under "other areas" found on-the-job or placement training occurring most often.

Possible course offerings are ranked according to their need in Table 5. The values assigned are averages as indicated by food store employees. The need for specific courses would vary for individuals training for food industry employment other than the retail food store. A graphic illustration of course needs is presented in Figure 1. Those listed on the left side are desirable and those on the right have less need.

Table 4 -- Response by Food Store Personnel Relative to Kinds of Vocational Training That Would Have Been Most Helpful in Their Work.

Job Title	Percent of Total				
	Interpersonal Relations & Communications	Business & Management	Commodity Handling & Distribution	Product Knowledge	Other Areas
Managers, Owner-Managers, Assistant Managers	64.0	56.1	69.3	15.8	12.3
Grocery Managers, Assistant Grocery Managers	61.9	66.7	81.0	9.5	14.3
Meat Managers, Assistant Meat Managers	44.6	42.5	72.3	34.0	23.4
Produce Managers, Assistant Produce Managers	55.0	45.0	60.0	35.0	22.4
Bakery, Delicatessan, Frozen Foods or Dairy Managers and Assistant Managers	33.3	53.3	60.0	13.3	6.7
Meat Cutters	41.3	38.3	58.8	38.5	23.5
Clerks, Stockboys, Checkers	44.6	35.7	58.9	8.9	3.6
Cashiers, Bookkeepers	68.3	45.4	72.9	9.1	4.5
Total	54.2	47.9	66.5	20.6	14.0

a. Scale: Large Need (5) (4) Moderate Need (3) (2) No Need (1)

Fifty-one food store managers were asked to identify vocational traits that enhance job advancement potential in food stores. One hundred ninety responses were elicited. These responses were classified under 7 major vocational trait headings. Data presented in Table 6 indicate that more managers (78.4 percent of total) chose the "Ability to get along with others" as a desired vocational trait more than any other single trait.

Figure 1: Relative Need for Courses in a Food Handling and Distribution Curriculum.

Table 6 -- Desirable Vocational Traits in Order of Importance as Indicated From Responses by Food Store Managers.

Vocational Traits	Number	Percent of Total[a].
Cooperative; able to get along with others; interest in work	40	78.4
Well informed about job	33	64.7
Responsible and Dependable	27	52.9
Does work well; makes few mistakes	25	49.0
Does work quickly and well; does extra work to keep busy	24	47.0
Personal Appearance	21	41.1
Adaptive; able to adjust quickly to new assignments	20	39.2
Total	190	

a. Total number of managers in sample equals 51.

All comments made by food store personnel and teachers were collected and analyzed for relative values. A summary of major opinions follow.

1. The possibility for Connecticut's food stores to serve as training stations where students could apply basic principles and updated techniques learned in the classroom to on-site food store operations problems was met with enthusiasm. Apropos of this finding, it was suggested that areas of training responsibility be defined as between food store and vocational schools in order to facilitate specialization in areas of greatest resourcefulness.

2. Also, astute observations were made regarding the relation between vocational and general education. While most supported the purpose of vocational education (to fit persons for gainful employment), they also indicated that in the final analysis we should be more interested in the <u>someone</u> students become rather than the <u>something</u> they become.[1]

[1] Hoyt, Kenneth. <u>The Challenge of Guidance to Vocational Education</u>. (Address during the 59th Annual Vocational Convention -- December 6 through 11, 1965, at Miami Beach, Florida.

Parameters for Vocational Training in Food Handling and Distribution

Broad parameters exist in vocational training in all the food related industries including food distribution. Job levels range from positions for handicapped and retarded persons to executives and research scientists. No single program can or should try to cover this entire range, but must necessarily limit itself to a specific segment of the whole. This curriculum guide presents the grocery store level positions and the curriculum necessary to train personnel for these positions. The fundamental nature of the program also qualifies students for many wholesale food positions and many staff food positions after experience on the job training are attained. Job experience is an integral part of the vocational training program.

The social aspects of a food store position are of paramount importance. The employee must cater to the customer's needs. Customers demand quality products, honest value, pleasant environment, and reputable personnel. The career employee in addition to constant customer contact, must also supervise other employees and accept supervision from higher company officials. Continual contact with other people thus is the rule for the food store positions.

The food trade demands certain skills that must be developed by employees. Meat cutters and bakers normally practice as apprentices before advancement to responsible positions. Produce, grocery, and frozen food managers must be knowledgeable of their products as well as able merchandisers. Accounting and inventory control skills are also requirements for advancement. Clerks and stock boys must be adept in pricing, shelf stocking, product control and sanitation. All store positions require some training.

Schools establish basic requirements for all of their students. These courses establish a core around which the applied and vocation related courses must build. Food and merchandising courses are dependent upon the background of the teacher and available facilities. New teaching programs may require teacher training. Facilities may be minimal if supplemented by close industry association. Facilities and teacher requirements are further developed in the full publication.

Student potential in a food distribution program must be developed. The tremendous opportunity exists for part-time food store employment at convenient hours during the students free time. However, interest must be nurtured to maintain student demand. This is enhanced by industry encouragement, job advancement, teacher enthusiasm, adequate counseling and parent acceptance. These must be integrated into the total program to insure a high percentage of satisfaction.

The data presented in the preceeding section point to opportunities for youth to enter the food industry, and indicate the preparation which would be helpful. Whether or not a particular school or

college should develop a program is a matter for decision by the governing board. However, many institutions offer some instruction in the areas indicated as important in this study. These institutions may find it desirable to experiment with curriculum which will strengthen their offerings designed specifically to prepare youth for careers in food handling and distribution.

In making a change in curriculum for a school or college it is well to approach the problem on an experimental or trial basis. This requires that the change be initiated in the nature of a pilot program with provisions for evaluating its effectiveness. Space does not permit a full discussion of all factors involved in operating a pilot or experimental program.

A pilot program in occupational education generally should provide the following:

1. Making a survey of local employment and/or training opportunities,

2. Organizing and meeting with an advisory committee which includes representatives from employers and employees,

3. Developing criteria which are to be used in selecting students,

4. Establishing courses of study and curriculum plans including work experience and practical laboratory experience,

5. Selecting teachers and/or coordinators,

6. Establishing policies and procedures for conducting and evaluating the program,

7. Involving faculty and parent to insure understanding of the proposed changes, and

8. Obtaining resources required.

Suggestions offered in the parent publication relate to (1) selection of teachers; (2) development of facilities; (3) selection of students; (4) use of work experience; and, (5) utilization of staff and physical resources. In addition, there is presented sample curriculum materials and an extensive bibliography. However, in this brief form only the more general recommendations of curriculum are presented.

Teacher Requirements

The primary purpose in vocational and post secondary or technical programs is development of occupational competency. To achieve this purpose, instruction is based upon practices and principles found in the occupational areas. Teachers require some knowledge of the occupation which may be gained through varying combinations of experience in the occupational field and formal schooling. Requirements are specified for teachers in public schools by the Connecticut State Board of Education. These regulations are published from time to time under the title of, "Regulations for Teachers Certificates."

Selected requirements for certification in vocational subjects are shown below:[1]

Subject Area/Level	Major Requirements
Vocational Technical	Eight years of experience and high school graduate
Vocational Agriculture	B.S. degree in agriculture and three years of experience
Vocational Home Making	B.S. in home economics
Distributive Education	B.S. degree and one year of experience

The certification regulations (current) apply to employment of teachers in designated instructional areas. As new courses and programs evolve, consideration is given to establishing specific regulations for teacher certification.

In the case of courses and programs in food handling and distribution, some anticipation of requirements is possible. Those courses which have a considerable body of abstract and technical content require a teacher who has mastered it. On the other hand, courses in which primary emphasis of content is on behaviors associated with work in food handling and distribution industries require some background or experience in the industry. Thus, programs of instruction might be expected to need teachers with different talents. The particular talents required will be conditioned, in part, by the courses to be taught or programs to be coordinated, which in turn reflect abilities and knowledge demanded in the occupational area. Regard is necessary also for developing instructors with sound orientation and intellectual base for maximum advancement of students in their careers.

---

1 Regulations for Teachers Certificates, Eleventh Edition, 1963, pages 16-18, Connecticut State Department of Education, Hartford, Connecticut.

In selecting or designating coordinators or teachers for courses in food handling and distribution, special consideration should be given to these competencies:

1. Interest in and general knowledge of occupations in the industry.

2. Knowledge and experience in selling -- with emphasis on fundamental human relations.

3. Knowledge of foods; standard varieties, grades and quality control, uses and value.

4. Knowledge and experience in store organization, operation, management and record keeping.

5. Knowledge of economies of marketing with special reference to the industry.

6. Skill and knowledge in meat cutting.

It is obvious that no one teacher is likely to meet all requirements. In post secondary institutions, specialization in course offerings makes possible a high agreement of the instructor's competency and course offerings. In secondary schools it may also be feasible to draw on special competencies of existing staff. These would include business, home economics, and vocational agriculture teachers. The requirements for a coordinator of the program at either level should include special emphasis on areas of food knowledge, salesmanship and store operations.

Beyond the desired personal qualities the "ideal" coordinator for a food handling and distribution program might have the following educational and experience background:

1. The equivalent of two full years of employment in the food industry -- this could include part-time employment. Quality of experience should be considered as well.

2. A Bachelor's Degree, with a major in food science or marketing and professional preparation for teaching.

3. A Master's Degree with additional work in food science marketing economics and related areas and successful teaching experiences.

School Facilities

The physical facilities for teaching food handling and distribution will vary considerably according to local situations, level of training, available space, funding support by local industry and the background of the faculty. In nearly every case, however, needs will change from time to time particularly as the program gorws and develops maturity.

A high school having no facilities for teaching food distribution may do well in designating one classroom to the subject. Where this is the case, space must be considered at a high premium and be utilized to the fullest. Advantage of complementary areas and facilities should be noted and evaluated. The single classroom should not duplicate food facilities in the home economics area, merchandising equipment in distributive education, or chemical ware of the physics and chemistry groups. Rather a spirit of cooperation must exist to the mutual gain of all.

The single classroom facility priority should center around an information reference source. If a good central library exists, text type references may be kept there plus trade journals after they have initially been circulated to interested persons. One area of the room should avail itself to reference material consisting of food marketing books, trade journals and newspapers, company publications, promotional literature and general food trade communications. Students exposed to these daily will make use of them. A second area should consist of a model display window or merchandising case. If a freezer is available it should be included. Frequently the food distribution students can obtain valuable experience in food merchandising and management by operating a concession to other students and staff. Financial returns can be used to support further training aids, outings to local businesses, and training trips to distant urban terminals during vacation periods. The concession need not be physically located in the food distribution classroom, but should have storage there and have management headquarters and accounting there. A portable type cash register will augment this. The center front of the room should have a teacher demonstration table equipped with a sink with hot and cold running water, electrical outlet, gas outlet, stainless steel table, and burner plates. Seating space normal to the classroom should be provided. In addition work tables for student participation are desirable. Storage space must be available for foods and equipment. Promotional display areas can be made up and help stimulate student interest.

A separate demonstration and participation laboratory allows more active student involvement. Each student should have his own bench space of approximately 30 inches minimum width, access to an adjacent sink, and a storage drawer or cabinet. Separate supply areas, equipment areas and refrigeration space can be common to all

users. Frequently local food stores will freely cooperate with the food training program and provide food at a discount for teaching and demonstration purposes. When food is at hand a merchandising area can be real and useful. Sale periods can be established to give students selling experience. Food distribution students can serve as the merchandisers for home economics baked goods, faculty specials and as caterers to sporting events and other social activities. The basic equipment necessary for these activities are display cabinets, refrigeration unit, sales counter, cash unit, record file and supply storage. A heat unit and coffee urn are normal for social activities. Portable units are preferred where no centralized unit exists.

Occupational Experience

Opportunities are abundant in most communities for gaining occupational experience. Minimum age standards prevent the very young from direct store employment. Sixteen is the minimum for most food companies. Students younger than this can seek school activities where food service is a part. School clubs and 4-H projects provide learning experience. As soon as the working age is attained, part-time employment in the retail food store compliments food handling skills. Restaurant work and other food service employment also provides good practical experience. Students should in addition seek opportunities with farms, processing plants, or food delivery companies to broaden their background of food production and marketing. The necessity for financial resources and proximity to the home are major factors in job selection during the school year.

Summer employment for students should be meaningful and broadening. Living accomodations and nearness to the home are again frequently prime factors. They tend to become of less importance as the students mature. Persons over 18 years of age should put the learning experience ahead of other criteria when at all possible in selecting their summer employment. Travel to other areas, states and out of the country is encouraged. Reading and self improvement should also be a part of the summer program. Teachers and guidance counselors should aid students in their summer placement.

The key to providing maximum learning through occupational experience programs is cooperative planning between students, teachers, employers and parents. Through cooperation all viewpoints are respected and mutually adjusted to the satisfaction of all parties concerned.

Student Selection

Student selection and recruitment for a food handling and distribution program should be based upon the student's interest in the field. This interest can be both stimulated and nurtured through direct contact with food distribution organizations and leaders. Part-time job opportunities are abundant in the supermarket. This experience can be the primary interest building media as well as an encouragement to further one's knowledge. The practical knowledge gained from part-time work also builds a confidence base to the industry if the part-time employee is allowed to perform several functions and is encouraged in his work. Teenagers find themselves working with teenagers. Responsible positions are gained as rapidly as the person can handle them. They observe there is plenty of room for advancement with no ceilings other than ability and perserverance.

High schools desiring to build up student enrollment in a food distribution program should work closely with local food markets, brokers, processors and institutional representatives. Part-time work and summer placement with these groups may serve as the initial interest builder. Speakers brought in to discuss their respective fields and career opportunities have limited appeal. Field trips to directly observe many occupations in their actual environment serves a good purpose.

Post high school programs tend to serve larger areas than the local community. Therefore, program promotion and recruitment must be carried out on a higher scale. Career day programs where high school students are brought in to observe the facilities and meet the faculty are usually fairly successful if adequate planning and announcements are accomplished. Most selection and recruitment can be carried out through key contacts which are secondary school teachers, guidance counselors, and food company personnel directors. Scholarships and work incentive plans are a definite aid in recruitment.

The academic standards need not be narrow for either secondary or post secondary student selection. The opportunities are vast and at all levels. The highly intelligent youth can reap major rewards from this vocational program. He need not feel it is terminal nor need his course program be of a terminal nature. Openings for more education will continually exist for those who are qualified. Vocational training is not a deterrent to further formal training. The many employment opportunities tend to inspirit direct application of the training for immediate financial gain. Even when this takes place, formal training should still be sought for the brighter individuals to aid their advancement.

Students of median range intelligence generally are more numerous in the food distribution area than those from higher or lower ranges. This is satisfactory as the greatest number of employment opportunities exist for the middle intelligence group. The lower 25 percentile of students could find menial opportunities but would have difficulty understanding the complexities of food retailing and could not assume positions of responsibility.

In all cases students selected for the program should be of high moral character, honest and possess integrity of action.

Interrelationships of Programs

A food handling and distribution curriculum can function efficiently in coordination with other vocational programs. Some of the units of instruction needed for this program will in many cases be similar to those needed for distributive education, vocational agriculture, science, business and home economics. This interdisciplinary demand both strengthens and broadens all the curricula involved in that it provides greater numbers of students and greater student interest when course work is shared by several areas. In addition facilities can be used more fully and supplies frequently can be made to serve more than one objective.

Vocational agriculture curricula offer several areas basic to food distribution. These frequently include identification of fruit and vegetable varieties and their seasonal availability, meat cutting and grading, poultry and egg grading, quality control and sanitation. Vocational agriculture teachers cooperating in the food distribution program need to be well versed in these areas plus knowledge in bacteriology, food preservation and marketing. Discussions on food production, processing and wholesaling can fit into the agricultural area.

The distributive education area will include units in retailing, store operations, salesmanship, and general merchandising. These units offer the fundamentals needed for food distribution oriented students. Classroom examples and business experience should center around food retailing if food students are handled separately. Lessons in cash register operation, check out skills, record keeping and general management techniques are identical for both food and nonfood retailing.

The science and biology departments should be familiar to the food distribution students. General courses in chemistry, biology and in some cases physics are in demand by students interested in food processing, preservation, inspection and quality control. These

fundamental courses have many applications in understanding food flavor control, sanitation, and public health standards. Since food is subject to metabolic changes and can easily become a public health hazard through misuse or misunderstanding, basic knowledge in these areas is important.

The business department courses in marketing, accounting, and business management will coincide with the food distribution business needs. It is not necessary or even recommended that food students be taught separate courses in these areas. Teachers need not place special emphasis on food retailing but should provide some problems and examples relevant to the food industry and point out areas of uniqueness within the industry.

The home economics department can make a significant contribution in nutrition, food preservation and consumer reactions. Since catering to the consumer's food needs is the major objective in food retailing, the home economics group will have much in common with the food distribution group and should serve as a compliment to each other. Cooperative courses by these two groups also aid in the boy-girl ratio and stimulates more class interest.

Summary of Findings

What Are the Manpower Needs for Food Store Personnel?

1. Six major food chain stores employed 20% of the total Connecticut food store work force in 1966.

2. There were 889 full-time and 3780 part-time openings reported by 6 major Connecticut food store chains in 1966.

Who Are Presently Employed in Food Stores?

1. Personnel identified in this study represented approximately 5% of Connecticut's total full-time food store work force.

2. The age of food store personnel responding to the first interview guide sheet ranged from 19 to 72 with a mean age of 36.6 years.

3. Years of formal schooling for food store personnel responding to the first interview guide sheet averaged 11.5 years. Eighty percent of the managers and owner-managers had the benefit of <u>at least</u> a high school education.

4. Eighty-eight percent of present managers and owner-managers were employed part-time while in high school; the majority having worked in food stores as clerks. Approximately 27 percent of present managers and owner-managers were employed part-time while attending post high school education institutions.

5. The majority of food store managers who continued their education beyond high school followed a business and marketing curriculum.

6. Seventy-six percent of present managers and owner-managers started their career as food store clerks. A greater percentage of post high school graduates started as assistant managers than did high school or grammar school graduates.

What Are the Food Store Job Satisfaction and Career Findings?

1. Ninety-seven percent of the food store personnel voiced satisfaction and enjoyment with their work, and 85.7 percent planned to make careers in the food distribution and grocery field.

2. Approximately 60 percent of food store personnel saw advancement potential for themselves. The greatest single factor that seemed to limit job advancement opportunity was a lack of necessary occupational preparation.

3. Three major factors contributed to job dissatisfaction; namely, (1) long and inconvenient hours, (2) lack of qualified help, and (3) customer-co-worker-employer aggravations.

Educational Needs for Food Store Personnel

1. Food store personnel indicated that work performance was positively related to the level of education of persons under their supervision.

2. Food store managers, other store personnel and teachers associated with the food industry indicated that more than a moderate need existed for food related courses in vocational schools.

3. Persons preparing for entry and ultimate advancement into managerial positions needed a common core of competencies in areas of human relations, mathematics, merchandising, marketing, salesmanship, product knowledge, business management, accounting and bookkeeping.

4. A definite need was cited for placement training and/or on-the-job training for successful preparation entry and advancement in food store occupations.

5. Personnel presently employed in food stores indicated that further education in business management and marketing would be most helpful in their work.

6. Different emphases, both in terms of number and subject of courses, was noted as between courses food store personnel indicated would have been helpful in their work (entry phase primarily) and courses regarded as helpful now (advancement phase primarily). The former emphasized human relations and mathematics competencies. The latter emphasized business management, marketing and merchandising.

7. Relative to vocational traits that enhance job advancement potential, food store managers regarded the "Ability to get along and work with others" as most important. A person "Well informed about his work" was next in line of importance.

Implications and Recommendations

Secondary Education: Most persons entering employment in food stores in the immediate future are likely to have little education beyond the secondary school level. Further, many youth will be employed in food stores on a part-time basis during their high school years. In many large communities, the number of youth involved and numbers of opportunities are sufficient to merit special consideration to developing a curriculum for occupational education in food handling and distribution. Considerable variation in subject matter and organization of such curriculum is possible. Each school involved should seek to determine what may best be done within its situation. This curriculum may be used as a general guide.

Proposed Secondary Curriculum

1. General education experiences should comprise about 75 percent of the program.

2. Part-time employment should be utilized as a required learning experience for which the school would assume some responsibility.

3. Special attention should be given to learning experiences in human relations. This may be accomplished through:

   a. class sessions of students who are employed on a part-time basis;

   b. a unit of work incorporated in a "marketing course," or

   c. a special course of human relations.

4. Experiences should be provided which aid students to acquire a broad knowledge of food products. Teachers of agriculture and home economics may well be involved in giving this instruction.

5. An area of vital importance is distribution or selling. This includes emphasis upon mathematics, merchandising and marketing.

6. In summary a curriculum would include the approximate equivalent of one full year of occupational instruction. This could be spread over at least two school years.

Post Secondary Education: Most persons having education beyond high school are or aspire to be in a managerial capacity. They are likely to be persons with previous employment experience. It is anticipated that an increasing proportion of the supervisory and management positions will be filled by persons having post secondary education. A number of post secondary institutions should find this a worthwhile offering to be developed.

Proposed Post Secondary Curriculum

1. Provision should be made for substantial offerings of a general nature to insure maximum educational advancement of individuals.

2. From 6 - 12 semester hours should be offered in food marketing and merchandising.

3. From 3 - 9 semester hours should be offered in product knowledge, including quality control.

4. From 3 - 6 semester hours should be offered in human relations with special emphasis on supervision.

5. Occupational experience should be required either as a pre-requisite to enrollment or during the period covered.

Adult Education: Consideration should be given to developing offerings for employed store personnel. On the basis of this study first consideration should be given to offerings in management which may enable persons to advance.

Secondary Level
Suggested Curriculum for Experimentation in Food Handling and Distribution

What the Employer Looks for in the High School Business Graduate.

Administrative Management Society, Battle Creek, Mich. Kalamazoo Chapter
MF AVAILABLE IN VT-ERIC SET.
Pub Date - 12Apr67 9p.

*EMPLOYMENT PRACTICES; *EMPLOYMENT QUALIFICATIONS; *EMPLOYER ATTITUDES; SURVEYS; *CLERICAL WORKERS; *HIGH SCHOOL GRADUATES

Thirty-six firms responded to a questionnaire concerning their employment practices of high school graduates for office occupations. The results are tabulated on the initial survey form. The questions included: (1) the number of employees normally employed and the frequency of employment of persons who have just graduated from high school as clerks, typists, stenographers, business machine operators, key punch operators, and switchboard operators, (2) minimum acceptable scores for employment tests in typing and shorthand and whether tests were given for dictaphone, arithmetic, manual dexterity, general intelligence, aptitude, spelling, and vocabulary, (3) degree of emphasis schools should place on certain subject matter (4) whether there was a position in business for the below average graduate, and (5) suggestions for preparing better qualified business graduates. Employers indicated that it was common practice to hire recent high school graduates. Opinion was evenly divided regarding a position in business for the below average graduate. Respondents indicated that the below average graduates must start at the lowest level with a generally poor chance for advancement. (PS)

April 12, 1967

APR 24 1967

Dear Participant:

Attached are the results of a survey conducted during the month of February. These results are tabulated on the initial survey forms so you may review the questions which were asked.

Thirty-six firms responded to the questionnaire. The figures in questions #1 and #2 represent the number of companies responding in each category and grouping, with totals to the right. The responses to question #2 from companies employing twenty-six or more people in each category were also reviewed separately. With the exception of one employer in one category only (keypunch operators) these companies indicated it was common practice to hire persons having just graduated from high school.

Since tests and minimum standards varied greatly, an analysis was made only of shorthand and typing tests. For the remaining tests, a notation is made only whether or not a test is given.

Thirty-four companies expressed their opinions in question #4. Two companies did not answer the question since their employee turnover had been nil during the past few years. As in questions #1 and #2, the numbers represent the number of companies responding under each category.

DIRECTORS, IN ADDITION TO THE OFFICERS
MANAGEMENT DEVELOPMENT, JAMES R. HOLLOWAY EDUCATION, DARRELL G. JONES CHAPTER SERVICES, JACK A. MEYER
PERSONNEL, JERRY W. DUKE ADMINISTRATIVE SERVICES, MARJORIE E. WHEATON, SYSTEMS, RAYMOND W. WEST

Opinion was quite evenly divided regarding a position in business for the below average graduate. The respondents were quite unanimous, however, in their opinion that these graduates must start in at the lowest level, with a generally poor chance for advancement.

We hope you find the information enclosed and above of interest to you. This material is being sent to the high school guidance counselors to whom we disseminated this information in a meeting with them last month.

Your comments on this survey would be appreciated. Please direct them to my attention.

Very truly yours,

K. C. Brown

YES - 16 NO - 15 No Ans - 5

5. With the emphasis in our schools today on the physical sciences, many businessmen and educators believe (rightly or wrongly) that in a great many cases, below average students are encouraged to take business courses only because they cannot qualify in the sciences. In your own business, do you believe there is a place for graduates who are below average intellectually? _____ If yes, what positions are available, and what are their chances for advancement? Positions available: Typing - 2, Clerks-16 Chances for advancement: Good - 4, Poor - 9, Depends on individual - 3

6. Please offer any suggestions which you believe would help our schools to prepare better qualified business graduates.

See attachment for suggestions

Would you please indicate the type of business you represent:

Advertisement Printing	1	Government	6
Banking	2	Public Utility	1
Insurance	3	Retail Sales	2
Educational	3	Transportation	0
Manufacturing	13	Other	5

#6

1. Place greatest emphasis on beginning skills.
2. Too few typists with shorthand ability.
3. Students need training in filling out job applications and in how to be interviewed.
4. More training in English Comp., grammar, spelling and math.
5. More emphasis on basics - english, math, etc.
6. Less business theory - more practical application.
7. Need greater motivation to give fair day's work, seek things to do, and expand knowledge. Taught value of neatness, accuracy, and honesty.
8. Greater emphasis on accuracy rather than speed.
9. Interest more young men in business field.
10. Schools should make greater use of business people to talk to students.
11. Encourage more bright people to stay with business courses.
12. More emphasis on job loyalty, self-confidence and pride of workmanship.
13. More emphasis in training students to work and communicate with others.
14. More communication between educators and employers.
15. Add key punch training to business courses.
16. Encourage more students to seek business training instead of college prep courses.
17. More participation in co-op programs prior to graduation.
18. More emphasis on english grammar.
19. More pride in work.
20. Better grooming.
21. More emphasis on quality of workmanship.
22. More training in basics of problem solving.

Contemporary Methods of Teaching Industrial Arts. Bulletin Number 8.

American Industrial Arts Association, Washington, D.C.
MF AVAILABLE IN VT-ERIC SET.
American Industrial Arts Association, 1201 16th St., N.W., Washington D.C. 20036 ($.50).
Pub Date - Jan65 18p.

*EDUCATIONAL METHODS; *INDUSTRIAL ARTS; *EDUCATIONAL PHILOSOPHY; *EDUCATIONAL OBJECTIVES

Industrial arts as an integral part of American education must plan an important role in these individual and national goals: (1) to guard the rights of the individual, (2) to provide for his fullfillment, (3) to enable him to achieve the promise that is in him, (4) to help him be worthy of a free society, and (5) to develop his capacity for strengthening a free society. The industrial arts teacher must examine the nature of his methodology to see if it educates for autocracy or democracy. Educational experiences will define the kinds of graduates and the kind of society for tomorrow. Methodology, content, and purposes have too often been separated for the sake of ease, convenience, and lack of foresight into their relatedness. Emphasis has been on the elements of a strong content which deals with programs, products, processes, occupations, and contributions of industry. The primary interest should be on the development of people. This emphasis on people would neccessitate a closer look at qualities of future citizens as well as some understanding of the changing society. Industrial arts can educate for flexibility that is needed. Its methodology can emphasize the individual, inquiry, an organismic psychology, a zest for learning spiral reinforcement and teachings as a creative art with a scientific base. Industrial arts methodology must seek its roots in the psychology, the sociology, and the technology of the age in which it operates. It will be contemporary to the degree that the profession moves from the mechanistic teaching approach to an approach that puts teaching in the realm of challenge and inquiry for both teacher and student. CONTEMPORARY

METHODS OF TEACHING INDUSTRIAL ARTS

VT003392

Dr. Donald Maley,
author of this bulletin,
is head of the Department
of Industrial Arts Education
for the University of Maryland,
College Park, Md.

N CONSIDERING contemporary methods of teaching industrial arts, let us establish a series of guides that will in some cases appear rather elementary, while others might give rise to some serious thought. As a point of departure one might begin to examine the nature of "contemporary methods."

What is the meaning of the words "contemporary methods?" What do these words imply? Do they mean methods that have just been established, or methods that appear to be presently popular? Rather than debate the issue of what is new or what is not new, we would like to place the discussion of contemporary methods in the matrix of pupil-educational activities, the role of industrial arts in American education, and, further, the role of American education in the contemporary culture. If one is to develop a workable concept of contemporary methodology, there must be a deep understanding of the functions and purposes of the system or society in which it exists.

The publication *Goals for Americans* contains in its introduction the following statement: "The paramount goal of the United States was set forth long ago. It is to guard the rights of the individual, to ensure his development, and to enlarge his opportunity."[4]*

As contemporary as these ideals may seem, they may be found set forth in the Declaration of Independence as adopted by the Continental Congress on July 4, 1776.

* For references, see the last page of the bulletin.

John W. Gardner in his discussion of "National Goals in Education" has stated:

> . . . Our deepest convictions impel us to foster individual fulfillment. We wish each one to achieve the promise that is in him. We wish each one to be worthy of a free society, and capable of strengthening a free society.
>
> Education is essential not only to individual fulfillment but to the vitality of our national life.[4]

There again we see emphasized the words—individual fulfillment—to achieve the promise that is in him—to be worthy of a free society—and the individual's capability of strengthening a free society.

We are confident that there is no disputing the efficacy, the dignity, and the inherent appropriateness of these goals for the citizen of today or tomorrow. The great points of differences that may arise among us, however, will surely come in the interpretation of the meaning of these lofty ideals, and, secondly, in how we set about to achieve the objectives so stated.

You may be concerned by now as to when we are going to talk about "contemporary methods for industrial arts." Also, we are adventuresome enough to speculate that each of you has a firm conviction that industrial arts deserves a prominent place in American education.

It is for this very reason that we have introduced this topic as we have—in order that we might make our first and perhaps most important point. Industrial arts as an integral part of American education must play an important role in the above mentioned individual and national goals—

To guard the rights of the individual.
To provide for individual fulfillment.
To achieve the promise that is in him.
To be worthy of a free society.
To aid in the individual's capacity of
strengthening a free society.

Now, we are not certain as to how some will translate that into tie racks, bread boards, pump lamps, globe value sections, twisted letter openers, printed name cards, take-home projects, and display case filling. With tradition as it is, however, some will try, and some will be encouraged to try.

The real significance of our first point is to underline the need for the industrial arts teachers, supervisors, and teacher educators to provide a form of content and methodology that is capable of

providing for individual fulfillment and a strengthening of our free society.

A further elaboration of this point deals with the idea that an educational system with sufficient support can develop the kinds of people and the kinds of behavior it wants. This fact is quite obvious as one views the effects of education as revealed in the Japanese, Italian, and German people of the period leading up to World War II. This fact is obvious today in the influence of education in Russia and other similar countries.

But, what about the American educational product? It too can be, and certainly will be, largely affected by the methodology used in our schools. Democracy requires a people capable of making decisions, capable of exerting the individual franchise, capable of making selections, and capable of solving problems. Furthermore, it requires a citizenry capable of leadership, followership, initiative, and inquiry.

It is here where the industrial arts teacher must examine the nature of his methodology. Does it educate for autocracy or does it educate for democracy? What kind of a society does one educate for when the decisions are entirely in the hands of the teacher—the items to be made, the material and tools to use, the finishes to be applied, etc? Even the procedures are neatly prescribed for the student! What kind of a society does one educate for where choice and leadership are strictly teacher functions? Leading, choosing, inquiring, problem solving, initiating, creating, and following are outcomes of educational programs where the methodology has been established on the American ideal, and the outcomes are based upon the needs of a citizen in a democracy. Educational experiences that boys and girls have in these self-realizing activities will, in a large measure, define the kinds of products from our schools, and the kind of society we will have tomorrow.

Our second major point ties in closely with the previous statement that linked content and methodology in the common purposes above. **It is almost impossible to consider methodology without considering content as well as purposes.** Too often we have been guilty of isolating each of these items for the sake of ease, convenience, and lack of foresight into their relatedness.

Industrial arts as a phase of general education has a strong body of content rooted in one of the most obvious and dynamic characteristics of the age—**industry.** The elements of this strong

content deal with the **problems, products, processes, occupations, and contributions of industry.** These elements as found in the definition of industrial arts focus rather sharply on the content with which to be dealt. The big unanswered questions remain in the area of how narrow or how broad do we deal with these elements? Are they just words put together to enable the student with a fair memory to pass his industrial arts theory courses? Few other areas of the school have such an interesting and dynamic content. The teacher's and pupil's resources in this content area are limitless, and the range of pupil experiences likewise is limitless. However, narrow concepts and inadequate backgrounds have not permitted many teachers to move beyond a mere token of content development at any level.

Coupled with this strong area of content is a more subtle and more important obligation in **the development of people.** Here again is a case of misdirected emphasis. The profession has spent years of preparation and operation focusing an undue amount of attention on things with too little **emphasis on people.**

As another guide post to contemporary methods of teaching industrial arts we would like to suggest that industry—its products, processes, etc.—constitute the content, but that we should be primarily interested in the development of people.

Industrial Arts

Content and Purpose

The Development of the Individual in terms of:	*The Interpretation of Industry in terms of:*
Products	his rights
Processes	his fulfillment
Problems	his promise
Occupations	his worth to a free society
Contributions	his strengthening of a free society

The Individual
as a
maximum contributor to a free society

The industrial arts profession at all levels would do well to reexamine its direction and activities in order that there be a rebirth of thinking about this primary and often-neglected responsibility. If you seek to quarrel with this point, we merely ask you to make a quick survey of the literature in the journals associated with industrial arts. This literature is largely "thing" centered rather than "people" centered. The emphasis is in the wrong direction. Industrial arts is teaching—not constructing, not manufacturing, and not the embellishing the crafts.

This emphasis on people would necessitate a closer look at some of the qualities that will be needed in the future citizen as well as some understanding of the changing society for which we educate.

Margaret Mead, in an article appearing in the October, 1959, issue of the *NEA Journal*, summarized the pace of modern man as follows: "No one will live his life in the world into which he was born and no one will die in the world in which he worked in his maturity."

It is this challenge of change that educators must face in the development of content and methodology. Further indications of change in our immediate past should give grave concern for the nature of contemporary methodology in industrial arts. Manufacturing employed 1,000,000 fewer production workers last year than six years ago, although production has gone up 20 per cent. Nearly two thirds of the new jobs added to the economy in the past five years has been in the state and local government, with most of those in teaching.

> Employment of professional and technical workers increased by 47 percent between 1950 and 1960—a rate of growth more than three times the average of all occupational groups.
>
> . . . . In 1956, for the first time in our history, professional, managerial, clerical, and sales employees outnumbered employees in manual occupations.
>
> Eight million men and women—about one out of every ten who did any work in 1961-changed jobs during the year.
>
> Of the 159 million persons 5 years old and over in 1960, 75 million had changed residences since 1955. Fourteen million, or about one-fifth of the movers, were living in a different state than 5 years before.[5]

These are just a few of the societal factors of production

improvement, population mobility, job changes, and employment structure with which the individual in this society must be prepared to cope. In addition to the above, there is the tremendous explosion of knowledge that has been created by research, exploration, and an increased emphasis on scholarship. The facts of yesteryear are in many instances overruled by the improved findings and data of today.

What then is the nature of educational content and methodology in any area of the school in an era of such change and dynamics? Edgar Dale, in an article titled "Education for Flexibility," has offered some interesting and insightful comments on this matter.[1]

> . . . . The world of tomorrow needs the flexible man, the intelligently mobile man, the man who can land on his feet when his job becomes technologically obsolescent.
>
> To educate for flexibility we must distinguish between training and education. To train is to emphasize fixed responses, to stress immediate goals which often have a low ceiling of possible growth. To educate, however, is to foster limitless growth, life-long learning.

The preceding comments should indeed cause serious thought for the development of contemporary methods. Are the methods of teaching industrial arts instruments of training or education? Training or education is not just a matter of what is taught, but is more closely aligned with how the subject is taught. The facility in thinking, inquiring, investigating, analyzing, relating, and challenging have long-range potential and are a vast departure from the repetition of the teacher's demonstrations just to accomplish a job or the parroting of answers to pass a test. Teaching industrial arts can be either training or education and in many instances, methodology is the contributing factor. In addition to how industrial arts is taught is the ever-present problem of what is taught. Both of these facets of questions must be faced in a new dimension of thought if the time and energies of both teachers and students are not to be divested in the realm of educational and societal obsolescence. This point is highlighted and put into perspective by Gardner in a recent article appearing in *Think*.[2]

> If we indoctrinate young people in an elaborate set of fixed beliefs, we are ensuring their early obsolescence. The alternative is to develop skills and habits of mind

which will be the instruments of continuous change and growth on the part of the individual. Then we will have fashioned a system that provides for its own continuous renewal. (This suggests a standard in terms of which we may judge the effectiveness of all education—and so judged, much education today is monumentally ineffective!)

The implications for Gardner's comments are obvious. The emphasis is in the direction of the kinds of skills and habits of mind that can be useful in promoting the continuous change and growth on the part of the individual.

And now you may be concerned about the role of industrial arts in such a system. How can its methodology contribute to the future citizenry? What changes in procedures, programs, and teacher education must we learn to accept and to study with sincerity and fortitude?

Some excellent guide posts have been suggested by Sands in a speech entitled "Curriculum Decisions for the Sixties."[3]

"It is possible that in the next decade we should consider moving in the following directions:

From	*To*
1. The group	The individual
2. Memory	Inquiry
3. Stimulus-Response Psychology	Organismic psychology
	Zest for learning
4. Spiritless climate	Spiral reinforcement
6. Repetition	Teaching as a creative art with a scientific base"
14. Teaching as telling	

We would like to add a further item to this list and it would involve a movement from confined, limited, specified content and requirements to a concept of limitless content and requirement.

The above emphasis upon the individual, upon inquiry, an organismic psychology, a zest for learning and spiral reinforcement are all well within the sphere of activity and potential for the industrial arts teacher. The future of industrial arts may well depend upon the degree to which its methodology is able to contribute to the individual through inquiry, etc., as outlined above by Sands. No other teacher in the school has a richer and more natural environment for such procedures.

The item dealing with "teaching as a creative art" has special appeal to teacher educators, and we would like to emphasize that

the whole area of methodology must get a re-evaluation in terms of its psychological and sociological appropriateness.

The study of methodology can not be in terms of prescriptions, tested projects, fixed procedures, and a nostalgic anchoring to tradition. Teaching as an art and teaching as a profession must be reinforced in the minds of those who will teach tomorrow. It is here where teacher education and in-service education in industrial arts can make significant gains if there is the willingness to make the step.

One imperative need that appears to stand out in the preparation of teachers is to develop teachers with the inquisitiveness of a child, an unending imagination, and a resolve for perfection in teaching that would compare favorably with the desire for perfection exhibited by Van Cliburn, Jascha Heifetz, Michelangelo, and Cellini. Let us develop teachers with the pride of craftsmanship in teaching that one finds in the great stonecutters, sculptors, painters, and musicians.

But even beyond these, let us develop teachers capable of designing experiences to achieve the goals established for education. The industrial arts college classes that deal with the design of projects are numerous. The industrial arts teacher in particular is drilled in the rudiments of project design and the procedures involved.

But have you ever heard of a class specifically dedicated to the design of educational experiences? This is fundamentally the job the teacher will eventually perform.

The fulfillment of the greatness in teaching and the fullness of satisfaction from teaching can only be achieved as the teacher explores, experiments, tests, and evaluates the process of teaching as an art of high professional calling. This idea is contrasted by the teacher who wants a course of study given to him, and has learned a fixed set of techniques, procedures, and projects to apply in all situations.

By way of analogy let us depart from the task of teacher preparation and assume we are in the business of training or educating sculptors, painters, or pianists. Would it be proper to spend a greater part of our curriculum theory to the development of hammers, chisels, and gauges, or paint brushes, pallets, and easels? Or in the case of the pianist, would we devote a major share of the curriculum time to the making of pianos, metronomes, or benches?

No, these are simply the "tools" of the sculptor, the painter, or

the pianists. The objective has not been to develop tool makers; it has been to develop people capable of conceiving in marble, clay or metal, the dimensional configuration expressive of the artist's mind and will.

Have we not devoted a great deal of time in the curriculum, and an equal or greater time and space in the "professional" literature on the business of tool making? Just ask the average industrial arts teacher or supervisor whether he would like to have an inservice course devoted to "tested" projects ("tools"), or an inservice course devoted to the principles and factors influencing learning, or a series of meetings devoted to technological changes.

The immediate response is that we must have something "practical." This narrow concept of practicality has virtually led the profession into a position of impracticality in an age of lunar probes, exotic metals, laser light, computers, and the marvels of modern technology. Industrial arts no longer can depend upon the collector of projects ("tested" or otherwise) to deal with the contemporary needs of man.

Let us more clearly examine what is "practical" for the teacher of industrial arts, and let us again devote our efforts toward the development of teachers of mankind at all levels. In essence, we would again like to challenge you to find or to think in terms of teacher education classes or inservice development programs specifically dedicated to the design of educational experiences.

And now in closing, let us say that this presentation has not attempted to present a cookbook, a series of orderly procedures, a list of tested projects, or a compilation of canned experiences to be taken and followed with diligence or vigor. Instead, we have tried to indicate some contemporary societal factors that the developers or users of methodology must take into account. We have tried to point out some trends and directions educational thought is taking. And above all, we have tried to induce the profession to give greater concern for the progress, movements, and dynamics of the society in which its methodology must function.

The role of industrial arts is highly dependent upon its methodology. The outcomes of its work are surely dependent upon its procedures. The richness and vitality of the source of industrial arts content is a factor of great personal and national importance. What is really needed is a re-evaluation of our teaching processes, and a genuine commitment to the education of people. When this is accomplished, the prestige and contribution of industrial

arts will assume a position of significance in any modern society.

This last point is brought into focus for industrial arts by a statement made by Vernon Anderson, dean of the college of education at the University of Maryland:

> At times I hear a teacher of one of the specialized fields virtually apologize for the fact that his subject does not appeal to the intellect, in this day of stress on intellectual attainment. Scholarship does not reside in a subject. The study of a subject becomes alive, an adventure in research, and experience in discovery, a scholarly pursuit, if the teacher has the insight and understanding to make it so. Industries have elaborate research departments. Industrial processes become more complicated, more advanced, as technological and scientific advances are made. There is every reason why industrial arts, as well as any subject, should be made an adventure.
>
> I would hope that the time will come when there are no "lower" or "upper" class subjects in the minds of students and educators. I would hope, too, that none of us will ever apologize for what we teach or depend upon some artificial "status" that it holds in the world today to give it respectability. For we who teach these subjects—industrial arts, social studies, mathematics, education—can give them the respectability they deserve, the rigor inherent in any field of investigation, the exciting stimulation that comes from an experience in discovery.

The challenge to make industrial arts an experience in discovery, an experience in inquiry, an experience aimed at the maximum fulfillment of people, capable of assuming their duties and responsibilities in a free society, is in reality the challenge of thought and action for industrial arts in the years ahead. Industrial arts methodology must seek its roots in the psychology, the sociology, and the technology of the age in which it operates. Contemporary methodology in industrial arts will in a large measure be contemporary to the degree that the profession moves from a mechanistic teaching approach to an approach that puts teaching in the realm of challenge and inquiry for both teacher and student.

VT003520

BACKGROUND

Established curricular guidelines in technical education are lacking, a situation which has occurred during a time of acknowledged shortages of qualified technical personnel, both in established and in emerging occupational areas. The correspondingly different philosophies, resources, and internal structures of diverse types of institutions are in many cases providing industry essentially with variations of the same product--the technician. Within this varied ideational and organizational framework lies a basic need for recognizing, identifying, and relating the technicians' functions in industry to the curricula which would best assure them of occupational competence.

A great deal of the significance of this study to education lies in the identification of attitudes of technically qualified management personnel toward post high school technical curricula. These respondents (a) have direct responsibility for job performance of the technical personnel, (b) have some technical background themselves, and (c) are assumed to have a higher degree of knowledge and concern for company objectives and policies in comparison with the technicians themselves.

OBJECTIVES

The purposes for which this study was conducted are:

(1) Compare assessments made by management toward technical curricula content with assessments made by technical personnel themselves.

(2) Isolate and analyze selected variables and measure their relationship to curricula recommendations.

(3) Establish and assess degree of relationship between level of authority of management and generality of recommendations for

curricula content.

(4) Identify a core of courses which management agrees is desirable for most post high school technical programs.

(5) Test hypotheses that management will include more kinds of course content in their recommendations compared with recommendations of technicians.

PROCEDURES

The numbered paragraphs in this section separate and describe the major definitions, instruments and procedures which were fundamental to the conduct of the study.

1. Technicians were used as the criterion group of respondents in this study; therefore, a definition was needed which would serve to distinguish them from skilled operators, craftsmen, and other workers, as well as from professional and other semiprofessional occupations. The definition selected appeared to include essentially all the desired types of workers in the manufacturing establishments in the sample. Technician was defined as follows:

> The engineering or scientific technician is usually employed in (1) research, design, or development; (2) production, operation, or control; (3) installation, maintenance, or sales. When serving in the first of these functional categories, he usually follows a course prescribed by a scientist or engineer but (may or) may not work closely under his direction. When active in the third category, he is frequently performing a task that would otherwise have to be done by an engineer.
>
> In executing his function, the scientific or engineering technician is required to use a high degree of rational thinking and to employ post-secondary-school mathematics and principles of physical and natural science. He thereby assumes the more routine engineering functions necessary in a growing technologically based economy. He must effectively communicate scientific

or engineering ideas mathematically, graphically, and linguistically.[1]

Persons who had attained the baccalaureate and who were employed as technicians were excluded from the study as technicians.

2. Management and/or supervisory personnel also were utilized as respondents. Management is defined as describing those employees in positions within three steps of authority above and responsible for the work of at least one technician. Formal company organizational structure was not used as the total pattern for this identification, but rather responsibility for the work of one or more technicians was the prime criterion. Levels of management refers merely to the number of steps of authority removed from a given technician's job.

3. The initial portion of the sample of firms was randomly selected from the universe of manufacturing establishments in Illinois, as listed by the Illinois State Employment Service. 500 firms were so identified for possible participation in Project 2048* (Cooperative Research Branch, U.S.O.E., completed December, 1964). 40 of the larger firms in the 2048 sample were utilized in furnishing respondents for the writer's doctoral dissertation, 39 of which were used in this study (S-196). 13 additional firms from the same universe were added in July, 1965 to produce a total of 52 establishments, each of which employed 200 or more persons, and each of which supplied two, three, or four respondents for this study.

Participation by level of respondent was as follows: 52 technicians, 52 Management one, 46 Management two, and 18 Management three. Of

---

[1]Proposed by President's Committee on Scientists and Engineers

*The investigator was employed as a research associate on the Project 2048 staff, University of Illinois, Urbana.

the listed numbers, data from 39 of the technician respondents were used in both Projects 2048 and S-196, but the remaining 129 respondents were in no way connected to Project 2048.

The firms identified after July 1, 1965 were selected from product manufacturing classifications which would improve the sample's representativeness to manufacturing firms in Illinois as distributed in census manufacturing classifications.

4. An interview schedule and a curriculum deck were the two instruments utilized in this study. The interview form was closely structured and designed for numerically coded responses. Recorded were: age of respondent, manufacturing classification of employing firm, educational background, information on current job, time with present company, and data which identify each management respondent's working relationship to the technician respondent from the same firm.

Each technician and each management respondent were interviewed and all responses were recorded by the interviewer.

The curriculum deck was comprised of 99 3 x 5 cards which contained essentially all subjects, or course content, which might be considered related to technician job performance. The deck was designed for use in Project 2048 while the investigator of this project was employed on its staff.

Each technician (one from each firm) sorted the deck into three stacks in terms of relatedness to his own job; viz: related, somewhat related, and unrelated. Each management respondent sorted the cards similarly, i.e.: into three stacks of relatedness in terms of the job of the technician in the same firm. Hence, there were as many as

four sets of responses to each technician job; (1) those of the technician, (2) those of his direct supervisor, (3) those of a second level of supervision, and (4) those of his department head, chief engineer, or other person whose functions were three steps removed from the technician but who still maintained responsibility for the technician's work. Thus, one technician and one, two, or three management respondents (from each firm) participated. In the remainder of this summary the four levels of respondents will be referred to as T, M_1, M_2, and M_3.

5. Actually two types of data were procured. A rather limited body of descriptive data was obtained which was used primarily to validate the levels structure established for the study. Experimental data were comprised of responses to the curriculum deck; these data were utilized in analyses and/or comparisons of curricular recommendations and for establishment of the cores of recommendations as described in the objectives.

6. A system of job families was established for the classification of respondents in which 46 of the 52 technician jobs in the study had respondents (moving upward only through M_2). Classifications and number of technicians in each are: Electro-Mechanical, 8; Mechanical, 21; Chem-Mechanical, 7; Chemical, 5; and Chemical-Foods, 4. It must be remembered that three respondents (T, M_1 and M_2) contributed data to each job family classification. A total of 45 is indicated because no analysis was performed for the Electrical family; it had only one technician respondent.

7. A general core of curricular recommendations (as contained on the cards) was identified as agreed upon by respondents of all five job families. Individual cores by job family were then identified. Each individual core was intended to contain the more differentiated content for a given job family and was considered as above and in addition to the general core.

Selection of cards for the general core was based on a scoring system of three points for each related response, two for each somewhat related, and one for each unrelated. The mean score for each card was then calculated for each group of respondents (T, M_1, and M_2). If any one of the three groups (across all five job families) rated the card 2.0 or above, the card was included in the general core. A parallel procedure was used for selection of cards for each individual core, but it utilized only those respondents who were concerned with a technician in that job family for which the core was being established. These procedures essentially allowed any group of respondents, T, M_1, or M_2, to identify a card for placement in a core. M_3 respondents were omitted from the core selections because of their limitation to only 18 technician respondents.

8. The .05 significance level was considered as minimal in all portions of the analysis.

One-way analysis of variance was used for multiple comparisons of mean responses for the three levels of respondents (T, M_1 and M_2), the purpose of which was to compare their relative contributions to each of the cores. When significant differences were found, Newman-Keuls

procedures were used for establishing which means were significantly different.

Kruskal-Wallis one way analysis of variance was used in several portions of the analysis. Groups of respondents T, M_1, M_2, and M_3 were compared on age, salary, and other characteristics. It was also used for comparisons of management and technician responses to the card sort.

Rank difference correlation was used to assess for relationships between card sort ranks of Project 2048 technicians and each of the four groups of respondents in this study. The ranks assigned to the 99 cards were determined by the frequency of related response given the card by all respondents in each group.

RESULTS

The findings of the study are grouped into three divisions, i.e.: (1) differences between technicians and management, (2) identification of the core programs, and (3) comparisons with Project 2048. They are explained as follows:

(1) Age, educational attainment, salary, time on present job, and time with present company were analyzed for differences among the groups (levels). Application of Kruskal-Wallis one way analysis of variance produced significant values of H ($P < .02$) for the first three variables mentioned. The significant values of H and the consistency of the intervals among the means provide a basis for accepting the means of the groups as different from each other.

(2) Content of the general and individual cores was identified and summarized below:

A. General core (by card numbers)

1. Written and oral communication

17. Use of simple test equipment

52. Algebraic graphing, powers, roots, radicals

53. Metric system and square root, plane and solid geometry

66. ASA standards, use of handbooks, graphical treatment of empirical data

77. Use of measuring equipment to control a system

79. Calibration and use of typical industrial and laboratory instruments

98. Environmental testing of components, parts and products

B. The individual cores were identified and summarized as follows:

Electro-Mechanical - (by card numbers)

3. Numerical control, data processing, interpretation of engineering drawings

4. Thermosetting and thermoplastic materials; films, enamels, paints

8. Analysis and design of basic electromic circuits

12. Coulomb's Law, electrostatics, AC and DC theory

18. Principles of pulse and timing circuits

26. Basic psychology in planning, conducting, and evaluation of conferences and interviews

34. Composition and resolution of forces, Newton's Law, rotational motion, elasticity

35. Metal forming including machining, chemical milling, spinning, explosive forming

37. Metal forming including diecasting, casting, forming, extruding

38. Applied statics and strength of materials

44. (PERT) Selecting and sequencing of specific identifiable events necessary to successful completion of a project

46. Differential calculus

47. Graphical solution of problems involving points, lines, revolutions, intersections

51. Trigonometry

57. Vacuum tube and transistor theory

60. Analytic geometry

61. Sketching forms from observation

63. Machines elements and calculations

65. Preparation of block diagrams, schematics, layouts

67. Projection and graphic representation

70. Ferrous and non-ferrous metal heat treating, composition

71. Circuit theory, video amplifiers, tuned amplifiers

72. Pattern drafting and layout

73. Metal fabrication

75. Use of synchros and synchromechanisms, industrial control circuitry

80. Basic laws and theories of elements, compounds

89. Mechanics of fluids, temperature scales, thermal expansion

Mechanical -

For the sake of brevity cards in this core will be noted only by number if included in the previous core.

Cards 3,35,37,38,44,47,51,61,63,65,67,70,72,73 are listed accordingly (refer to pages eight and nine for content summary). One card of this core was not included previously; it is:

56. Linear, radical and quadratic equations, binomial theorems, complex numbers

Chem-Mechanical -

Cards numbers 3,34,35,37,38,47,51,61,63,67,70,72,80, previously summarized in the Electro-Mechanical core, were identified in this family. Cards included which have not been discussed previously were:

27. Time study and science of management

33. Tension and compression, Hooke's Law

83. Chemical testing of industrial materials and products

85. Carbon compounds, their structures

90. Atoms, single crystals and polycrystalline materials, nature and making of alloys

99. Equations of state, the first and second laws of thermodynamics

Chemical and Chemical-Foods -

Cores were identified for these two job families, but because of the small number of technician jobs to which were responded (n=4, n=5), no description is included in this summary.

(3) This third category of findings revealed that the responses of the technicians, Management one, Management two, and Management

three, all were closely related to the card ranks assigned by the technicians in Project 2048. High correlations ($P < .001$) were obtained between the technician responses of that project and each group in this study. The obtained value of r' was progressively lower for each higher level of management. Direct comparisons of card ranks for each group show isolated differences, but not large enough to affect a decision on the importance of each of the highly ranked cards. Card number one, oral and written communication, was ranked slightly lower by management, but still high in relation to the total deck.

CONCLUSIONS AND IMPLICATIONS

Implications for this study are considered as greatest in the Mechanical family of technician occupations. The analyses, findings and conclusions offered for the remaining four families are considered strongly suggestive of curricular concerns in their respective disciplines, but they may not be generalizeable to the universe of technicians in each of those occupational areas.

The results of the job classifications admittedly lie outside the objectives of this study. However, they are mentioned because of the surprising number of technician jobs which appeared as "hybrids" rather than as Electrical, Mechanical, or Chemical. All except one of the technicians interviewed from within the electrical manufacturing area were classified as Electro-Mechanical rather than as Electrical. If hybrid technical occupations are increasing or changing, the need for systematic identification of the extent and direction of that change is necessary. Programs of study which purport to prepare

competent technicians must provide subject matter and skill development in areas which are consistent with occupational requirements.

This study was based on an assumption which at this time is pertinent to mention. It was assumed that management and/or supervisory personnel employed in the participating firms would be both willing and capable of cooperating in supplying the desired judgments as necessary to complete the card sort. This assumption has been verified as correct. There were very few cases observed in which respondents did not willingly work the interviews into their already busy work schedules.

The notion that management and technician respondents would differ measurably in their curricular recommendations has been concluded as untenable. A very close similarity of recommendations among the groups was indicated by the tests, which led instead, to the conclusion that views of the two groups (as tested) were essentially the same. The core recommendations were concluded to represent the collective views of management and technician respondents. These cores are recommended for use as guidelines in the design and refinement of post high school technical programs.

INDIANA

The research staff of the Indiana Employment Security Division compiled this listing of research reports, survey reports, descriptive reports, articles, books, and papers written in Indiana and related to manpower. For each publication, arranged alphabetically by author, complete bibliographic data is supplemented with brief statements of objectives and procedures. Included are research projects not yet completed and their expected dates of completion. Most documents were published later than 1963. The second Inventory, compiled in July 1967, is VT 003 781 (ARM Winter 1968) and the third Inventory, compiled in May 1968, is VT 007 279 (ARM Summer 1969). (ET)

Inventory of Manpower Research Projects in Indiana

At the Indiana Manpower Research Conference held in Indianapolis on December 7-8, 1965, the conferees agreed that it would be mutually beneficial to continue efforts to advance manpower research, create a repository of related studies and data, coordinate activities, and establish liaison among researchers and users. With knowledge of completed, on-going and planned manpower research, as well as knowledge of needs, it may be possible to discover research gaps and reduce any duplication.

The Research staff of the Indiana Employment Security Division was asked to serve as a "point of contact" among investigators, prepare a listing of manpower research projects and maintain a repository of a set of publications. To this end, the projects reported by conferees and others were compiled for the first inventory. Inquiries and requests for additional copies may be directed to Research and Statistics, Indiana Employment Security Division, 10 North Senate Ave., Indianapolis, Indiana 46204.

If you are conducting or know of research projects which have not been included in this inventory, please help to achieve a more complete listing by using the reporting form on the last page. We also ask you to send information about or copies of studies completed during the past two years so that the repository of manpower research can be actively realized. These projects will be included in supplements which will be distributed periodically.

Purdue University, School of Technology
A STUDY OF THE NEED FOR EDUCATIONAL AND TRAINING ADJUSTMENTS IN APPRENTICESHIP PROGRAMS FOR SELECTED CRAFT OCCUPATIONS
(Special report to OMAT, Aug.-Sept. 1967)

The goals for this national project include attempts:

1. To develop procedures, or guidelines--perhaps, a pattern or framework--for an optimum apprenticeship training system(s);

2. To compare contemporary training systems with the optimum; and

3. To generate suggestions, if needed, for the improvement of ongoing programs.

The interdisciplinary team, composed of research scientists from Industrial Engineering, Sociology, Industrial Education, Labor relations and Economics, and Industrial Psychology, will analyze data obtained from individuals and organizations involved in the apprenticeship system by a variety of survey instruments. To determine a pattern for an optimum apprenticeship training system, consideration will be given to:

1. The basic criteria of accrediting agencies.

2. The factors basic to the development of superior workers who adapt to technological and other changes.

3. The discriminators between superior and other types of training programs.

4. The kinds of analyses and feedback systems which must be identified and used to keep workers in a state of operational readiness.

DATA PROCESSING SYSTEMS AND EMPLOYMENT EXPECTATIONS: INDIANAPOLIS
(Booklet, January 1964)

This study examined the scope, variety and magnitude of data processing systems and employment in the Indianapolis SMSA during March-April 1963. Estimates of the future status of data processing systems and employment expectations for the various occupations were made, based upon employer responses.

REGIONAL DISTRIBUTION OF SCIENTIFIC TALENT
(Article, Southern Economic Journal, Jan. 1965)

Analyzes and discusses the state-by-state distribution of scientists and technical personnel and how this is changing over time.

INDIANA EMPLOYMENT SECURITY DIVISION, RESEARCH AND STATISTICS
THE ADJUSTMENTS AND RESOURCES OF TEC CLAIMANTS
(Report to Department of Labor)

This study will examine the experience of TEC claimants in thirteen states. The nature of the adjustments which had to be made by the claimants, and the resources available to them are being analyzed.

INDIANA EMPLOYMENT SECURITY DIVISION, RESEARCH AND STATISTICS
AGE LIMITATIONS IN HIRING IN THE INDIANAPOLIS AREA
(Booklet, Sept. 1963)

This study examines the upper age limits specified by Indianapolis employers. A sample survey of employers was made to ascertain factors behind upper age limits on job openings. Local office job orders were examined for age restrictions. Data on the age distribution of applicants and placements were also used.

INDIANA EMPLOYMENT SECURITY DIVISION, RESEARCH AND STATISTICS
CHARACTERISTICS OF THE UNEMPLOYED IN THE INDIANAPOLIS AREA
(Booklet, September 1964)

This study analyzes data on education and race of the unemployed in Indianapolis in March 1964, in terms of age, occupational skill level and claimant status. Labor force and population data from the 1960 Census provides a frame of reference for the survey.

INDIANA EMPLOYMENT SECURITY DIVISION, RESEARCH AND STATISTICS
EVANSVILLE AREA SKILL SURVEY
(Booklet, July-1966)

This study will assess the supply and demand in occupations vital to the economy of the Evansville area. An employer survey is being conducted in Warrick, Vanderburgh and Henderson Counties to project needs for training in these occupations. A survey of local schools is being conducted to predict supply of trained people in these occupations. Local offices also made applicant file survey.

INDIANA EMPLOYMENT SECURITY DIVISION, RESEARCH AND STATISTICS
INDIANA JOB VACANCIES
(Booklet, Dec. 1964)

Job vacancy surveys were conducted in September and October 1964 in seven areas: Evansville, Ft. Wayne, Gary-Hammond-East Chicago, Indianapolis, Muncie, South Bend and Terre Haute.

The Indiana surveys followed closely, but not exactly, the pattern of a series of Federally-sponsored surveys in other selected areas across the country and were undertaken for the following specific purposes:

1. To obtain information about the number, location and kinds of unfilled jobs.

2. To determine the occupations for which there is a shortage of qualified workers so that training for these can be initiated or accelerated.

3. To determine whether or not the types of job orders in local offices of the Indiana State Employment Service are representative of the types of jobs which are unfilled in an area.

4. To find out whether or not the job vacancies existing in industry could be filled by the unemployed workers registered in local employment offices.

INDIANA EMPLOYMENT SECURITY DIVISION, RESEARCH AND STATISTICS
INDIANA'S LOW INCOME FAMILIES
(Booklet, March 1964)

This release presented data abstracted from the 1960 Census on the incidence and location of families with incomes under $ 3,000.

INDIANA EMPLOYMENT SECURITY DIVISION, RESEARCH AND STATISTICS
INDIANA MANPOWER REPORT 1964
(Booklet, Nov. 1964)

This report presents some of the economic factors which have affected employment. The manpower situation is depicted in terms of the changing age distribution of the population and the labor force, and employment changes in the industries. Areas of concern in manpower and development are indicated.

INDIANA EMPLOYMENT SECURITY DIVISION, RESEARCH AND STATISTICS
JOBS FOR YOUTH
(Four booklets, August 1964)

The study was designed to obtain additional information about the types of jobs that are available to youth between the ages of 16 and 24, and what requirements and educational achievement employers feel are necessary for people entering these jobs. About 1,800 employers in four southwestern counties (Gibson, Posey, Vanderburgh, and Warrick) were surveyed during October 1963.

Part I contains a summary of the findings, description of the survey, and a tabular arrangement of the employer responses regarding company training programs, need for additional training, and hiring practices, by industry and firm size.

Part II contains the inventory of occupations suitable for youth, by occupational group.

Part III has the skills or knowledge necessary for entry into occupations for youth, by occupation and industry.

Part IV contains the occupations for youth arranged by industry.

INDIANA EMPLOYMENT SECURITY DIVISION, RESEARCH AND STATISTICS
LABOR MOBILITY DEMONSTRATION PROJECT IN SOUTH BEND
(Administrative report, May 1966)

This pilot project is designed to assess or demonstrate the effectiveness in reducing unemployment by means of programs increasing the mobility of unemployed workers through the provision of assistance for relocation expenses. The South Bend study includes unemployed MDTA graduates only.

INDIANA EMPLOYMENT SECURITY DIVISION, RESEARCH AND STATISTICS
LAFAYETTE VOCATIONAL TRAINING SURVEY
(Booklet, April 1966)

This study was made to find out what jobs were suitable for inexperienced youth in the area and to assess the skills and knowledge needed by high school graduates to qualify them for these jobs. The results of this study are to be used in revising the vocational training facilities in the Lafayette area.

INDIANA EMPLOYMENT SECURITY DIVISION, RESEARCH AND STATISTICS
MANPOWER TRENDS TO 1975
(Booklet, May 1966)

This report will present projections of the population, labor force, employment by industry, and employment by occupation.

INDIANA EMPLOYMENT SECURITY DIVISION, RESEARCH AND STATISTICS
NEW PLANTS IN INDIANA SINCE JANUARY 1964
(Article in Labor Market Trends in Indiana, October 1965)

This article presents data on the industries represented, employment and location of new plants in the state between January 1964 and June 1965.

INDIANA EMPLOYMENT SECURITY DIVISION, RESEARCH AND STATISTICS
OCCUPATIONAL SHORTAGES IN INDIANA HOSPITALS
(Booklet, Nov. 1963)

This survey made in cooperation with the Indiana Hospital Association locates shortage occupations in hospitals in Indiana by local office area.

INDIANA EMPLOYMENT SECURITY DIVISION, RESEARCH AND STATISTICS
SURVEY TO DETERMINE REASONS FOR UNEMPLOYMENT
(Quarterly interim reports, booklet, Fall 1967)

This study will examine the reasons for unemployment during a time when the economy is booming. Data will be obtained from a survey of people who file for benefits during Fiscal Year 1967.

INDIANA EMPLOYMENT SECURITY DIVISION, RESEARCH AND STATISTICS
TEMPORARY EXTENDED UNEMPLOYMENT COMPENSATION RESEARCH SERIES
(Booklets: see below)

1. Employment and Family Characteristics of Indiana's Extended Benefit Claimants - (November 1961). This release covers some of the results obtained in the May 1961 survey.

2. Comparison of Backlog and Current Claimants - (February 1963). This also pertains to May 1961 survey claimants. It presents a comparison of characteristics and experience of claimants who exhausted their regular claim by April 1, 1961 with those who exhausted their regular claim sometime after April 1, 1961.

3. Personal Characteristics and Family Status of TEC Claimants - (April 1963). This release pertains to claimants interviewed in the four survey periods.

4. Work History and Benefit Experience of TEC Claimants - (May 1963). This release also pertains to claimants interviewed in the four survey periods.

5. Education and Vocational Training of TEC Claimants - (August 1963). This release pertains to claimants interviewed in the first three of the four survey periods.

6. Characteristics of Regular Claimants and Comparison with TEC Claimants - (Mar. 1964). This study examines the personal characteristics, family status, work history and benefit experience of claimants during three survey periods.

7. Post-Exhaustion Experience of TEC Claimants (in process). This study examines the labor force status of the claimants after they had exhausted their benefits, and characteristics of those who had left the labor force versus those who were working or looking for work.

INDIANA EMPLOYMENT SECURITY DIVISION, RESEARCH AND STATISTICS
WEEKS OF WORK AND WEEKLY WAGES
(Booklet)

In this study, an analysis will be made of the weeks of work and earnings for each week during the 52 weeks preceding the claim. A sample of people who filed new claims for unemployment benefits was selected, and their previous employers furnished the necessary data.

INDIANA EMPLOYMENT SECURITY DIVISION, RESEARCH AND STATISTICS
WHITEWATER VOCATIONAL SCHOOL TRAINING SURVEY
(Booklet, January 1966)

The objective of this project was to find out what skills and knowledge inexperienced youths need to learn in high school to qualify them for jobs in local industries after graduation. An employer survey was conducted by the local office and the results compiled, analyzed and published by the Research and Statistics Section.

A MANPOWER REPORT FOR TECHNICIAN - LEVEL EDUCATIONAL PLANNING CONCERNING THE CHEMICAL TECHNOLOGY IN THE STATE OF INDIANA
(Mimeo. report, October 1965)

This study examines the industries related to the chemical technology in Indiana. It considers the National aspects briefly to provide bases for comparison and perspective. The needs are determined for chemical technicians and metallurgical engineering technicians by industries in major metropolitan areas.

Data are presented showing numbers of employees, trends, size and location of firms, occupations, and other pertinent information for the chemical, rubber and plastics, primary metals, food processing, and petroleum industries. Ratios of scientists and engineers, and of technicians to total employment are computed for each industry and selected industry subgroups. Parameters are found on one side by using actual (existing) ratios of technicians to total employment, and on the other by those ratios recommended by authorities as desirable. The 'new hires' portion of labor accessions are applied to determine an approximation of the numbers of technicians required annually for each industry by geographic area within Indiana.

Discussion of the orientation of these technician programs, curricula guidance matters and collateral items are also included.

LISACK, J. P.
Purdue University, School of Technology, Office of Manpower Studies
A MANPOWER STUDY FOR TECHNICIAN-LEVEL EDUCATIONAL PLANNING, IN THE GREATER LAFAYETTE AREA, CONCERNING THE ELECTRICAL/ELECTRONIC TECHNOLOGY
(Pamphlet, February 1, 1966)

The objective of this study was to determine the number of technicians required annually in selected industries related to this technology: e.g. Elec. Mach., Equip. & Supplies; Communication; and Elec. Util. Companies, with State and National trends and requirements.

Employment for past ten years in significant industries was examined and rates of growth projected. Percentage of engineers and technicians to total employment was determined. New hire rates were developed and applied to compute numbers of technicians needed.

Assumptions used to form low and high parameters of requirements.

Applicable occupations presented, suggested curricula for electrical and electronic technologies attached.

LOEFF, JOAN

INDIANA YOUTH CONSERVATION WORK CAMP: A TRAINING CAMP APPROACH TO THE PROBLEM OF YOUTH UNEMPLOYMENT
(M.S. thesis, Brooklyn College, Sept. 1965)

This thesis studies the operation of The Youth Conservation Work Camp in Harrison State Forest; evaluates the effectiveness of this type of camp in terms of its contributions to the improvement of employability of youth who participated in the project; and brings out some significant lessons that emerge for the employment of disadvantaged youth generally.

The thesis describes and evaluates the methods involved in assessing the applicants chosen; analyzes the composition of the trainee group; and evaluates the results of the program (a) six months and (b) one year after the completion of training, by comparing the employment experience of the trainees to that of a group of young men who did not receive training. The post-training employment experience includes comparisons of such economic characteristics as: proportions employed and unemployed; industries in which jobs are secured; types of occupations secured; number of different jobs secured in each six month period and the duration of employment for all jobs secured and for the longest held job.

IMPACT OF TECHNOLOGICAL CHANGE ON THE STEELWORKER CASE STUDY: INLAND STEEL CORPORATION
(Ph.D. Thesis, March 1, 1966)

The objective of this study is to obtain factual data to support or refute the many charges made as to the impact of technological change on the worker. It is also hoped that the data will support a change from the traditional way (the standard hourly wage) in which a worker's plight or well being is measured after a technological change.

The earnings record, hours worked, vacation pay, educational level, race, age, company service, marital status, number of dependents and recruitment area for the period 1950 through 1964 was obtained fo all employees involved in the 10 technological changes occurring a Inland Steel, Harbor Works, since 1953.

Before and after earnings curves for each employee will be calculated, and recovery period determined, if appropriate. It is hoped that the individual earnings curves will be sufficiently similar to allow the construction of an earnings curve or curves for each technological change. The individual technological change curves will be examined in an attempt to find a common pattern. If one should exist, then there exists a possibility for constructing a model in which future changes could be applied and results of outcome predicted.

INVENTORY OF INDIANA MANPOWER RESEARCH PROJECTS

At the Manpower Research Conference held in Indianapolis on December 7 and 8, it was agreed that initially the Research staff of the Indiana Employment Security Division would serve as a "point of contact" among investigators, prepare a listing of manpower research studies and maintain a repository of a set of publications. Projects reported after the first inventory will be included in supplements which will be distributed periodically.

Please complete the form(s) for projects you have completed during the past two years and for projects you are now conducting. If possible, please send single copies of your publications to be included in the manpower research library. Send the forms and publications to The Indiana Manpower Research Conference at the address below.

Sincerely,

Dwight Kelley

FOREWORD

The constantly changing world of work brought about by technological developments in production industries has led to new concepts and patterns in preparing workers for employment. The resulting impact on vocational and technical education is nowhere more pronounced than in technical, industrial, trade, and health occupations fields.

This publication has been prepared to provide guidelines for persons who have responsibilities for evaluating present programs discussed in this bulletin, and for giving general direction to the development of new programs.

More than 80 occupational fields are charted to show the minimum number of clock hours considered necessary to provide students with minimum occupational competencies in each field. The instructional hours are listed for learning the manipulative skills of the occupational field and the clock hours of related training in technical subjects required. Each major field is identified by Dictionary of Occupational Titles code number to enable the reader to find the job description under each job title.

A series of diagrams describe selected job "clusters" designed to show the relationship between certain job skills and a wide range of occupations in which these skills are essential.

The Appendix describes the characteristics of trade, industrial, technical and health occupations, qualifications of program personnel, certification requirements, and the institutions of higher education in Michigan designated by the State Board of Education for the preparation of trade and industrial education teachers.

Ira Polley
State Superintendent of
Public Instruction

SUGGESTIONS FOR PROGRAM DEVELOPMENT IN TRADE & INDUSTRIAL OCCUPATIONS

Introduction

Concepts expressed in the Vocational Education Act of 1963 present a challenge which educators may wish to explore in developing a more comprehensive occupational education program.

This Act specifically states that the instructional program must be designed to prepare persons for gainful employment in recognized occupations. The instruction must be sufficiently extensive in duration and intensive within a scheduled unit of time to enable the student to develop essential competencies to enter and retain employment in an occupation or occupational field. The assistance of potential employers, and other individuals with substantial skills and knowledge in the occupation or occupational field, is a requisite in developing the instructional program.

Fortunately, in trade and industrial education previous experience in programming for many of the skilled trades has provided helpful information for this guide. Advice of trade associations has been sought and appears as the recommended length of program in such occupations as:- Automotive, Cosmetology, Dental Assistant, Electronic Technician, Practical Nurse, and Welding.

Although this bulletin stresses the development of preparatory programs at the secondary level, the information on this and the following pages will be found of value in preparing programs for people with special needs and upgrading workers for new industrial developments.

Organization

Philosophically a change in class organization and student involvement may be essential if vocational education is to serve the needs of a maximum number of students.

The Vocational Act of 1963 provides a potential for program development which may be structured to meet the needs, interest, and abilities of a great number of students provided the instructor recognizes the potential of each student. Counseling and guidance should be optimum if the student is to understand the occupational requirements and the goals that may be attained following completion of the various programs.

Instructors must understand that a student may have a potential for certain occupational accomplishments but other factors may limit the extent of participation. For example, in the metals area a program organized under the title of "Machine Tool Operator" could fulfil the occupational goals of students with varying ability in metal occupations. Those youth interested in building proficiencies as machine tool operators could gain the essential entry skills in a relatively short time, while others with more ability and interest may continue in training, gaining basic general entry skills for the machine trades.

Classes organized to prepare individuals with entry skills of an occupation may follow various patterns for manipulative and technical development.

Scheduling the classes may vary, but at all times consideration should be given to maximum benefits to the student. The length of the program will vary with the objective and may spread over a one-, two-, or three-year period. The student level at which a program begins is determined by age limits set forth in the Vocational Education Act. In the secondary school several factors may contribute to concentrating the occupational training program in the 11th and 12th grades, although the involvement of the 10th grade should not be overlooked. In determining when or at what level to initiate an occupational preparatory program, these factors are of prime consideration:-

a. Age requirement for entry into the occupation
b. Basic time needed to prepare for job entry
c. Maturity of learner
d. Availability for employment at termination of training
e. Value to the individual as a contributing citizen

When teaching of manipulative skills is an essential part of the program, consecutive periods spanning a minimum of two clock hours are important to the student's development. Schools having block time scheduling will likely find it convenient to schedule the longer periods so that the students may have adequate time for machine set-ups and other functions which consume considerable time. Such scheduling is important for classes regularly held at locations outside of the shop facility, as in the case of constructing a building.

In many cases at least half of the total instructional time will be devoted to the development of manipulative skills. The exact break between theory and practice will be determined by the job requirements.

Patterns for Providing Related Instruction

Related instruction, which is an essential part of each occupational preparatory program, may be taught in the shop by the trade instructor. It may also be taught in a separate room, thus freeing the shop for other classes. In the event the same related instruction is essential to students enrolled in other vocational classes, all such students may be included in a single related class provided the student-teacher ratio will permit.

Another method of providing related instruction would be by assignment to classes already in existence provided the subject matter is that needed by the student. If both vocational and non-vocational students are enrolled in the same class, the teacher's salary is not reimbursable from vocational funds.

The following chart is intended as a guide in providing minimum standards for determining the length of occupational preparatory programs. A variation in the length of a program of about ten percent is acceptable, if certain school organization problems form a block to the given recommendation.

OCCUPATION	MINIMUM TIME ALLOTMENT - PERCENTAGE OF TOTAL HOURS		MINIMUM LENGTH OF PROGRAM IN HOURS
	Manipulative	Related Technical Subjects	
Acetylene Welders 4-85.030	85	15	200

SUGGESTIONS FOR CURRICULUM BUILDING LEADING TO OCCUPATIONAL PREPARATION

Completion of any one of the occupational areas in the 11th grade may provide adequate background for cooperative occupational training during the 12th grade. Completion of any one of the occupational areas designated will provide a minimum of 900 hours of occupation preparation exclusive of other essential related subjects. The program will provide opportunity for trainees to complete training for lesser job activities during the 2-year period.

Some occupations for which trainee will receive training are: operator of the various metal working machines, tinsmith, coremaker, foundryman, set-up man, metal finisher, heat treater, welder, machinist, wrought iron worker, job estimator.

Cooperative training could be a valuable part of the training.

Proper structuring of the above courses will provide for minimal job proficiencies and also make room for the over-all planning for entry into the major occupation.

Some occupations which the above outline of programs will assist students in obtaining the necessary skills are: cabinet maker, furniture maker, machine operator, rough carpenter, finish carpenter, injection molder, boat builder, model maker, fiber glasser, repairman, etc.

Cooperative occupational training may be a valuable part of the training program.

Occupations requiring lesser skills than the major occupations should be included in the program plans. Each of the above programs should provide a minimum of 900 hours of instruction.

SUGGESTIONS FOR CURRICULUM BUILDING LEADING TO OCCUPATIONAL PREPARATION

10TH GRADE PRE-VOCATION SHOPS - 1 HOUR PER DAY

POWER SOURCES

11TH GRADE OCCUPATIONAL PREPARATORY PROGRAMS FOR DEVELOPING SKILLS AND KNOWLEDGE FOR JOB ENTRY 2 HOURS PER DAY

- AERO MECHANIC
- INDUSTRIAL EQUIPMENT CONTROLS
- ELECTRICAL APPLIANCE SERVICEMAN
- ELECTRONICS
- ELECTRICITY
- AUTO MECHANICS
- SMALL ENG. & EQUIPMENT SERVICEMAN
- HEATING AIR CONDITION REFRIGERATION

COOPERATIVE OCCUPATIONAL TRAINING

12TH GRADE CONTINUATION OF OCCUPATIONAL PREPARATION 3 HOURS PER DAY INCLUDING TECHNICAL RELATED SUBJECTS

Occupations

AERO MECHANIC	INDUSTRIAL EQUIPMENT CONTROLS	ELECTRICAL APPLIANCE SERVICEMAN	ELECTRONICS	ELECTRICITY	AUTO MECHANICS	SMALL ENG. & EQUIPMENT SERVICEMAN	HEATING AIR CONDITION REFRIGERATION
Frame	Pneumatic Control Mech	Washing Machine Repair	T.V. Repairman	Electrician	Auto Mechanic	Lawn Mower Repair	Furnace Installer
Body	Industrial Electronic Mechanic	Dryer Repair	Radio "	Electric Motor Repair	Tune-up Mech.	Outboard Motor Repair	Refrigerator Service
Engine		Household Electrical Equipment Repair		Industrial Electrician	Partsman		Air Condition Service
Mechanics				Meter "	Transmission Man		
				Wireman	Greaser		
				Lineman	Washer		
					Polisher		
					Gas Station Attendant		
					Aero Mechanic		

Completion of any one of the occupational areas in the 11th grade may provide adequate background for cooperative occupational training during the 12th grade. Completion of any one of the occupational areas designated will provide a minimum of 900 hours of occupational preparation exclusive of other essential related subjects. The programs outlined will also provide opportunity for individuals to complete training for jobs requiring lesser proficiencies.

Some occupations for which trainee will qualify: operator of the printing machines on which training took place, compositor, bookbinding, stamp making, machine repairman, camerman, plate making, typesetting.

Cooperative training may be a valuable part of training in any of the occupational areas.

Courses properly structured will provide for the student needing short-range preparation, as well as for those who desire to work toward competency in the major occupation. This will mean a possibility of at least 900 hours of instruction over a two-year period.

A student initiating a program in the 10th grade and continuing through 12th grade in the same occupation should complete a minimum of 900 to 1,080 hours of education and training. The first figure should be considered minimum instructional time to prepare in-school youth for entry into the major foods occupations. Youth attempting to qualify for food trades jobs requiring a lesser number of skills may terminate prior to completion of the 900 hours.

APPENDIX

CHARACTERISTICS OF TRADE AND INDUSTRIAL, HEALTH AND TECHNICAL COURSES OR PROGRAMS
VOCATIONAL EDUCATION ACT 1963

Type of Program	Basic Purpose of Training	Minimum Length of Program	Class Schedule	Class Size	Minimum Age of Students	Occupational Status of Students	Reimbursable Services
Preparatory High School Post- High School Socio-- Economic Disadvantage	To prepare individuals for employment in recognized occupations	The length of the program will be determined by an analysis of the skills and knowledge required to build entry skills for the occupation for which training is designed	Of sufficient duration to provide entry skills for the occupation. Time and length of individual class periods may vary	Should not exceed the number of available work stations	14 or over	Full time students who have recorded their occupational objective	Instruction Practical Shop Related Subjects Coordination Supervision Local Travel Placement - Counseling Equipment Construction of Area Schools
	To prepare youth and adults for employment as Practical Nurses	48 weeks of at least 30 hours per week of combined instruction and clinical experience	Any time of day or night	Clinical and classroom facilities available	18 yrs. or over or 14 years and left full-time school	May or may not be employed	Coordination Teachers Local Travel Equipment
Apprenticeship Craft and Industrial	To extend the trade knowledge and skill of apprentices employed in an apprenticeable occupation	144 clock hours of related instruction per year. Instruction as stated in the Standard for the trade or occupation	any time of day and in agreement with the apprentice Standards	Limited only by the available facilities and qualified instructors	16 yrs. of age or older	Actively employed in apprenticeable occupation	Coordination Teachers Local Travel Equipment

CHARACTERISTICS OF TRADE AND INDUSTRIAL, HEALTH AND TECHNICAL COURSES OR PROGRAMS
VOCATIONAL EDUCATION ACT 1963

Type of Program	Basic Purpose of Training	Minimum Length of Program	Class Schedule	Class Size	Minimum Age of Students	Occupational Status of Students	Reimbursable Services
Cooperative Occupational Training	To provide basic competencies in occupations which fit the trainees' needs, abilities and interests	Depends on the length of time required by trainee to acquire the basic competencies of the chosen occupation	At a time when the trainee is not on the job. An average of one class period per day	Vary according to the class facilities and students to be served	16 yrs. of age or older	Actively employed part time with a minimum of 15 hours per week over the length of the student's program	Coordination Teachers Local Travel Equipment
Technical	Designed to train persons for employment as highly skilled technicians in occupations requiring scientific knowledge in fields necessary to the national defense or those emerging from new and changing technologies	Content and length of program are based on an analysis of the job or cluster of jobs. Science, mathematics and advanced technical skills contribute greatly to the program content	Any time of day or night. Preparatory programs usually identified with day school curricula	According to facilities and equipment available	9th Grade or 16 yrs. of age or older	Preparatory, designed for full-time students. Supplemental for employed or temporarily unemployed	Coordination Teachers Local Travel Equipment Placement Counseling

CHARACTERISTICS OF TRADE AND INDUSTRIAL, HEALTH AND TECHNICAL COURSES OR PROGRAMS

VOCATIONAL EDUCATION ACT 1963

Type of Program	Basic Purpose of Training	Minumum Length of Program	Class Schedule	Class Size	Minumum Age of Students	Occupational Status of Students	Reimbursable Services
Supplementary	To train and retrain, improve and upgrade the occupational competency of the individual in recognized occupations	Instruction must be confined to that which is supplemental to the daily employment of those enrolled. To be considered supplemental to the daily employment, the instruction must be such as to increase the skill or knowledge of the worker in the trade or industrial occupation in which the person is employed	Of sufficient duration and intensity within a scheduled unit of time to enable the development of competencies necessary to fit the individual for employment in the occupation. Time and length of individual class periods may vary	Should not exceed the number of available work stations or exceed good instructional procedures and policies	16 or over	Employed or temporarily unemployed	Instruction Practical Shop Related Subjects Coordination Supervision Local Travel Placement - Counseling Equipment Construction of Area Schools

Note:- Funds will not be available for the preparation of individuals for occupations generally considered professional or as requiring a baccalaureate or higher degree. Needy students enrolled in an occupational preparatory program may receive financial aid providing they meet the qualifications set forth in the Work-Study program 5.0 of the State Plan.

MINIMUM QUALIFICATIONS FOR PERSONNEL OF
REIMBURSABLE TRADE AND INDUSTRIAL PROGRAMS
FOR INITIAL CERTIFICATION

Type of Service	Education	Work Experience Outside Teaching	Teaching Experience
Trade, Occupation, and Related Subjects Teacher	Baccalaureate degree in Industrial Arts, Industrial Education or Engineering	Three years during last 10 years in occupation to be taught	None
	- - - - - - - - or - - - - - - - - - - - - -		
	High School Completion	Qualified worker or journeyman in the occupation or trade	None
Related Subjects Teacher	Degree in subject area	One year in occupational area of subject to be taught	None
Health Occupations -Administrator	Michigan teaching certificate issued on the basis of education and knowledge of health occupations	Four years in fields of nursing education and/or administration in related health services	None
Nursing Arts Instructor	Registered or eligible to be registered as a nurse in Michigan	One year of experience in nursing occupation	None
Foods and Nutrition Instructor	Bachelor's degree in foods preparation or nutrition	None	One year foods preparation
Technical Occupations Supervisor Coordinator	Bachelor's degree from a college or university recognized by the State Board. One additional year in V.E. or completed 24 semester hours in the field to be supervised	Three years in a recognized technical occupation	One year Instruction Supervision or Administration

Type of Service	Education	Work Experience Outside Teaching	Teaching Experience
Technical Instructor	Hold or be eligible to hold a Michigan teaching certificate Teachers of trade practices may qualify	Three years in the occupational area in which instruction is to be given, or three years in a combination of technical occupations related to that to be taught	None
Related Subjects	Same as above	Demonstrate knowledge of subject in relation to technical occupational area	None
Coordinator Cooperative Training	Baccalaureate degree in major occupational area to be coordinated	Two years in occupational area to be coordinated	None
Health Occupations	Hold a recognized certificate or license in field of specialization	"	"
Supervisor	Bachelor's degree in Industrial Education	Three years of recent employment	Must qualify as a trades teacher or coordinator

Note:- Under certain circumstances an applicant who does not fully meet the qualifications as an instructor or coordinator may apply for the administration of a competency examination.

PLAN FOR THE CERTIFICATION OF TEACHERS AND COORDINATORS OF TRADE AND TECHNICAL EDUCATION

TYPES OF CERTIFICATES - Special, 1 year. First certificate issued
Secondary Provisional (Valid 5 years)
Secondary Permanent

SPECIAL CERTIFICATE

Conditions of Issuance

A person who meets the minimum requirements outlined in the Michigan State Plan for Vocational Education will be eligible for a special certificate valid for 1 year, upon the request of the administrative officer of the employing school.

Conditions of Renewal

A. A person who does not qualify for a secondary provisional may have the certificate renewed upon request from the administrative officer of the employing school. (Form 108)

B. A person who will devote 12 hours or less per week teaching approved trade and technical supplementary or part-time classes may have the certificate renewed for a period of (3) years upon application of the administrative officer of the employing school. (Form 108)

SECONDARY PROVISIONAL CERTIFICATE

Conditions of Issuance

A person who meets the minimum requirements outlined in the Michigan State Plan for Vocational Education may be granted a secondary provisional certificate valid for 5 years under the following conditions:

A. Has a bachelor's degree from an institution of higher learning recognized by the State Board of Education.

B. Has 12 or more semester hours, or equivalent term hours, of credit in professional vocational trade and technical courses approved by the State Board of Education, or

has completed one year of teaching experience acceptable to the State Board of Education.

Conditions of Renewal

The secondary provisional certificate shall be renewed for a person who has completed 12 semester hours, or equivalent term hours, of credit applying on requirements for a permanent certificate, but does not have the necessary 3 years of teaching experience required for a permanent certificate.

A person who does not qualify for a renewal of the secondary provisional certificate or for a secondary permanent certificate will be eligible only for a special 1-year certificate upon the recommendation of the administrative official of the employing school.

SECONDARY PERMANENT CERTIFICATE

Conditions of Issuance

At the termination of the 5-year period in which the secondary provisional certificate is valid, the teacher must have completed the following requirements in order to be eligible for a secondary permanent certificate:

A. Three years or more of teaching experience in the subject area specified on the certificate.

B. At least 12 semester hours, or equivalent term hours, of credit in trade and technical education courses acceptable to the State Board of Education.

PROCEDURE FOR PROCESSING APPLICATIONS FOR CERTIFICATION IN TRADE AND TECHNICAL EDUCATION

In all cases, first applicants for certification must complete Vocational Education Forms 151, 108 and Teacher Oath Certificates. These forms must be signed by the applicant and the local administrative officer who will forward the forms to the State Board of Education or to the vocational education institution of the candidate's choice as follows:

A. Special Certificates

1. Candidates may make application directly to the State Department of Education, Division of Vocational Teacher Certification, Bauch Building, P. O. Box 928, Lansing if the following conditions apply:

   a. Never previously applied for a certificate
   b. Education attained in another state
   c. Primarily teacher of adult vocational education

2. Eligible vocational education students enrolled in class at a designated teacher education institution may have the teacher educator make a recommendation for approval of certification if the educational and practical experience requirement stated in the Michigan State Plan for Vocational Education are fulfilled.

B. Secondary Provisional Certificate

1. Candidates who are graduates of designated Michigan Teacher Institutions may ask the designated institution to have the following forms completed and signed by a representative of the department or unit of the institution responsible for the candidate's program of vocational teacher education.

   a. Form 175 (in duplicate) Certified List of Recommended Candidates for Vocational Certificates
   b. Form 151 Statement of Qualifications for Teachers of Vocational Classes
   c. Form 108 Application for Vocational Certificate to Teach Vocational Classes
   d. Teacher's Oath Card and Sticker

2. The registrar or other official designated by the institution will process the forms and submit them to the Department of Education.

3. For candidates who are graduates of institutions not designated by the State Board of Education, application will be made by the candidate through his employing Michigan school official direct to the Department of Education. Use Vocational Education Forms 151, 108 and Teacher Oath Sticker.

C. Vocational Secondary Permanent Certificate

For eligible candidates who are recommended by a Michigan teacher education institution designated by the State Board of Education to prepare vocational trade and technical education teachers.

1. The institution upon request of a candidate for a vocational secondary permanent certificate, whose qualifications are on file with the Division of Vocational Education, will provide the candidate with the Form 108-A (in triplicate) to be completed and returned to the designated institution.

2. Upon receipt of the completed application (108-A), the institution responsible for the program will review the candidate's status (course credits and teaching experience), and recommend to the State Board of Education a vocational secondary permanent certificate, if requirements have been met.

3. Two copies of each application (108-A) will be forwarded to the registrar or other official designated by the institution.

4. The registrar or other official designated by the institution submits original copy of application (108-A) to the Department of Education. If the institution is recommending a dual secondary permanent certificate for the candidate, it will prepare a certificate as supplied by the Department of Education to accompany the application (108-A).

5. For those persons who have been on vocational contract three years or more with all required qualifying conditions for certification completed outside of Michigan teacher education institutions, Vocational Education Form 108 and Teacher Oath Sticker should be completed. Mail these forms together with a transcript of credit to the Department of Education.

NOTE: Applicants for positions in community colleges must meet the minimum qualifications for a teacher as stated in the Michigan State Plan for Vocational Education and make application to the Department of Education. Such applicants, if the conditions set forth in the State Plan are satisfied, will receive notification of approval and no further action will be required other than policy of the employing institution.

Address all correspondence regarding certification to the Department of Education, Division of Vocational Teacher Certification, Bauch Building, P. O. Box 928, Lansing, 48904.

I. ABSTRACT

A practical procedure was developed for deriving the kind of concrete, accurate and specific goals needed for drastic improvement of instructional programs from medical laboratory technicians. The goals are in the form of detailed behavioral specifications of the technical skills, background knowledge and personal traits desired in technicians.

II. THE PROBLEM AND ITS BACKGROUND

All programs of higher education known to the principal investigator are aimed at goals stated in the liberal-arts tradition of high level abstractions. A survey of relevant literature revealed no procedure for deriving tangible goals, or even a suggestion of its need or potential importance. Development of such a procedure was a major objective of this project.

A survey of catalogs of liberal-arts colleges revealed a consistent practice of stating goals only in such terms as the liberation of men from the meagerness of mere existence, learning to understand and appreciate our cultural heritage, development of wisdom, development of mental maturity, etc. Further refinement of programs aimed at such goals can apparently happen only by happy accident. There is no way of determining within a usefully short time whether any given change of curriculum or didactic procedure has helped or hindered progress toward the goals, thus there can be no rational basis for planning changes. Faculty committees and educational conferences can provide at best only a consensus of intuitions or subjective evaluations by which an individual teacher may go safely with the crowd, but he cannot know in what direction he is moving with respect to the hazy goals. The situation is analogous to trying to improve marksmanship by altering gunsights and ammunition when the target is too remote for impact points to be observed directly.

A survey of catalogs of schools of law, medicine, engineering, nursing medical technology, etc. reveal close adherence to the liberal-arts tradition of goals and standards, and thus rational refinement of these programs is apparently impossible by traditional methods.

It should be emphasized that the preceding comments apply only to further refinements. Intangible goals have obviously not prevented development of an effective system of higher education. The millions of students who have passed through and emerged satisfactorily educated are direct evidence of its effectiveness. Hazy goals, intuition and subjective evaluation were good enough for this first rough pioneering stage of development, but further refinement will require a much higher order of specificity and accuracy of inquiry and observation.

III. PROCEDURES AND RESULTS

The procedure used was evental analysis, which consists essentially of describing a situation entirely in terms of real objects and real events, that is, describing it with childlike simplicity and directness. It is based on the realization that ones sensory input and therefore ones total awareness of the public world ~~is~~ are entirely as sensory impressions of tangible objects and their tangible changes. These are the basic irreducible elements of cognition, and all human knowledge and wisdom concerning the public world are reducible to them. Thus statements about that world must be reducible to these elements to be accurate and meaningful.

Evental analysis in educational research directs inquiry toward what a student can do rather than what he has been exposed to, toward what he does rather than what he is said to be. The key questioning is of the form, "What must I see a _____ do in order that I would say he is _____?" For example, how does a technician differ from a layman, that is, what must I see a person do in order that I would call him a technician and not a layman? What must I see a technician do in order that I would call him an experienced old pro rather than a competent novice?

Evental definition of a competent novice technician

A technician solves problems (where a problem is an undesired object or event and a solution consists of the events necessary to transform or replace it) that a layman does not. A particular list of problems would define his skill. The list could be derived by functional analysis of his job, and this approach was pursued until a simpler one became apparent. Simplification came

with the realization that a description of mechanical steps is not necessary in defining a skill. Instead, a skill can be defined in terms of performance of a practical test where the examinee is required to perform a complete procedure within specified limits of time and accuracy. These two measurables, time and accuracy, provide an overall test for competence on all steps of the procedure, and thus individual steps need not be considered. The competent novice level of technician can be defined in terms of certain groups of laboratory procedures he must perform satisfactorily under test conditions. Such testing is well within the state of the art and requires only routine development.

Elimination of routine functional analysis allowed earlier concentration on the task of deriving exact evental definitions of important characteristics usually described vaguely as experience, grasp of scientific principles, judgment, responsibility, motivation, etc.

Evental definition of experience

What must one see a technician do in order to call him an experienced old pro rather than merely a competent novice? The physician ordering the laboratory work is concerned mainly with reliability of results. From his viewpoint the main element of experience is a low probability of a plausible but seriously erroneous result. This statistic could be estimated directly from past errors, but frequency of occurrence is very low and thus gathering the necessary data appeared impractically difficult. A simplifying assumption permits a reasonable and useful indirect approximation.

A competent novice is trained to recognize and avoid common procedural mistakes leading to erroneous results. With time on the job (experience) comes opportunity to make unusual errors and to see them made by co-workers. As he becomes familiar with a longer and longer list of errors and remembers how to avoid them, the probability of his making a serious error can reasonably be expected to decrease, and this simplifying assumption is made here.

Evental specification of the primary component of that abstract quality called experience can thus be narrowed to a list of definitive errors and how to avoid them.

Derivation of errors definitive of the primary component of experience

Laboratory procedures selected for study were those listed in a standard guidebook to a curriculum for certified laboratory assistants. The routine for each procedure was as follows. Textbooks were searched for known errors, and the data were assembled as a list of problems (observations of erroneous results) along with explanations and corrective actions. The list was shown to a chief technologist in charge of a clinical laboratory, and he was asked to make additions and corrections from his own experience. The process was repeated with other chief technologists. The data were grouped and assembled as Appendix A (108 pages) of the final report of the project. Examination questions (both true-false and multiple choice) were derived from Appendix A and were assembled as Appendix B (103 pages) of the final report.

The problems of Appendixes A and B should define those primary skills of the experienced old pro distinguishing him from a competent novice, and they should thus define exactly the content material that in-service training should aim at for rapid upgrading of primary skills, but actual testing of the material for discrimination and consistency (and thus testing the validity of the simplifying assumption) was beyond the scope of this project.

Evental specification of scientific background

Revising the science requirements offers opportunity for a major increase in efficiency of educational programs for laboratory technicians. Science requirements, which constitute a large part of these programs, are now specified entirely in terms of credit hours of coursework the student is exposed to rather than in terms of actual intellectual skills acquired. The rationale for selection of information for inclusion in such courses, as stated in the prefaces of standard modern textbooks, is vague, intuitive and ambiguous with the underlying tacit assumptions apparently never identified or examined. Evental analysis avoids this traditional confusion and leads directly to rational specifications.

What must I see or hear a technician do in order that I would say he has a good scientific background? Directly observable evidence would be his handling routine laboratory equipment familiarly and well, his predicting correctly the behavior of unfamiliar equipment, and his giving explanations for many technical events in the laboratory that agree with mine or exceed my knowledge.

Learning the skills and knowledge represented by the first two categories of evidence probably comes mostly from firsthand experience and seems to offer little chance for drastic improvement.

The third category (ability to explain events) involves the main body of information in science textbooks, and it offers opportunity for drastic improvement. All of the many modern textbooks reviewed were patterned for the traditional teaching approach of background-first-application-later wherein depth and scope of background are determined intuitively by the individual professor according to his taste or customs of his group. A symbolic device for evental analysis, the plane of events, fixes a pattern for analytical explanation in which depth, scope and method of inquiry are rigorously rational rather than intuitive and whimsical.

Most physical, chemical and biological phenomena encountered in the laboratory are suitable for analytically explanatory sequences. Exploration of these would establish the worthwhile so-called basic principles of science, that is, the analytical explanations common to many observable phenomena. Restricting exploration to events encountered in the real world of the clinical laboratory would avoid burdening students with recitation based on conjectural models constructed by researchers to explain rare events encountered only under the highly improbable conditions of a research laboratory--the glamorous sounding trivia that is so often peddled enthusiastically in academia as the very latest in up-to-date "sophisticated" Science.

Clear, concrete and rational specification of the amount of scientific background required for good performance of laboratory technicians could be made in terms of the number and kinds of events to be explained and in terms of the number of size-orders of analytical resolutions to be completed in each explanation. Empirical data required as a basis for these specifications is, of course, lacking at present, but gathering it would be only a routine research task.

Evental definition of personal traits

This was a bonus phase of the project that was pursued for a short time. A rationale was developed for applying evental analysis to those personal traits that weigh heavily in supervisory decisions about hiring, firing and

promotion. The necessary pattern of inquiry became clear: don't be concerned with defining any intangible characteristic or personal trait, per se, but instead collect accurate evental descriptions of conspicuously desirable and undesirable actions of technicians that have actually been observed by a reliable witness.

Interview techniques were worked out. Preliminary data were collected in 26 categories (ability to get along with other people, attitude, compassion, confidence, conscientiousness, creativity, curiosity, etc.) but were too meager to be worth summarizing yet. Collecting, compiling and interpreting the needed data would be a project worthy of a doctoral dissertation in human engineering.

A similar brief exploratory study was done on motivational factors. Again, evental analysis proved appropriate. The patterns of what data are needed and how to go about gathering them are now clear. Collecting and compiling the data will be a project worthy of a master's thesis in human engineering.

Baines, Thomas E.
The Effectiveness of a Distributive Education Preparatory Course on Student Progress in Distributive Education II.

Newport News Public Schools, Va.
MF AVAILABLE IN VT-ERIC SET.
Pub Date - 67 13p.

*DISTRIBUTIVE EDUCATION; *COMPARATIVE ANALYSIS; *PREVOCATIONAL EDUCATION; *COURSE EVALUATION; PERFORMANCE; STUDENT CHARACTERISTICS; STUDENT EVALUATION; HIGH SCHOOLS

The purpose of this study was to determine the effects of a preparatory course, Distributive Education I, on student interest, achievement, job placement and job performance in a Distributive Education II course. Eight sections of students (171) enrolled in the Distributive Education II Cooperative Program, 11th grade, in the six high schools of Newport News, Virginia, during the 1966-1967 school year were involved in this study. The experimental group were those students who took Distributive Education I and the control group were those students who did not. Some of the findings were: (1) The percentage of students who withdrew in the experimental group was 7.5 percent less than for the control group, (2) The vocational interests of students were significantly alike for both male and female students, (3) The vocational interests of male students gave a negative correlation and a high positive correlation for female students in both groups, (4) There were no significant mean differences between experimental and control group in the Achievement Survey Test, teacher marks, the time the students were recommended for job placement, or ratings on the Student Progress Report, but significant mean differences were found within the two groups. THE EFFECTIVENESS OF A DISTRIBUTIVE EDUCATION PREPARATORY COURSE ON STUDENT PROGRESS IN DISTRIBUTIVE EDUCATION II

by

Thomas E. Baines

I. Purpose

The purpose of this study was to determine the effects of a preparatory course, Distributive Education I, on student interest, achievement, job placement and job performance in the Distributive Education II Course.

II. Procedure

A. Definition of Terms

1. Experimental Group means those students who took Distributive Education I prior to taking Distributive Education II.

2. Control Group means those students who did not take a Distributive Education I course prior to taking Distributive Education II.

3. Distributive Education I, hereinafter referred to as DE I, was a pattern of instruction involving a series of learning activities or projects in the field of marketing, merchandising and management which are related to the student's occupational interests. This was a tenth-grade course offering.

4. Significant Difference is set at the .05 level.

B. Sampling

Eight sections of students (171) enrolled in the Distributive Education II Cooperative Program, eleventh grade, in the six high schools of Newport News, Virginia, during the 1966-1967 school year were involved in this study. The criteria for formulating an experimental and a control group were the mental ability test scores and whether or not the students had taken DE I prior to enrolling in DE II. Of the original 171 students 109 remained in the study, 57 in the experimental group and 52 in the control group.

C. Collection of Data

All students in the study were given the Otis Mental Ability Tests at the beginning of school in September.

A Distributive Education Achievement Survey Test was administered to the students in the experimental group and in the control group both in the fall and again in the spring.

Reading, Listening and Mathematics achievement tests scores as determined by the Sequential Tests of Educational Progress were tabulated for each student.

Scores on the Kuder Preference Test and on Gordon's Occupational Check List were compiled for each student.

Teacher marks in DE II, first and second semester, were tabulated for students in both groups.

Progress Reports for students, State Form DE 12, were prepared by employers for those students who were working at the end of the first and at the end of the third rating periods.

Records showing dates that students in the two groups were recommended by the teacher for job placement were tabulated for analysis.

Reports showing the date, group and the reason for student withdrawal from the DE II course were collect d and tabulated for comparison.

Semester grades for students in DE II were compared to determine if there was a significant difference in student achievement in the experimental and in the control groups.

Comparisons were made to determine the correlation between rankings by employers and by teachers on the ten items on the Student Progress Report, State Form DE 12.

III. Findings

TABLE 1

REGISTER OF STUDENTS INVOLVED IN THE STUDY

	Experimental Group	Control Group	Total
Number enrolled	88	83	171
Number withdrew	22	27	49
Incomplete records	9	4	13
Number remaining in study	57	52	109

Table 1 shows that 22 of 88 students enrolled in the experimental group and 23 of 83 enrolled in the control group withdrew from the DE II coursse. There were 7½% less withdrawals from the experimental group than from the control group. This difference is significant.

TABLE 2

REASONS FOR WITHDRAWALS FROM THE DE II COURSE

Reasons	Experimental Group	Control Group	Total
Moved out of city	3	3	6
Changed career goals	2	7	9
Graduated first semester		3	3
Unemployed, disinterested	5	5	10
Schedule change	1	2	3
Needed more time for study	1	1	2
Academic failure		2	2
Released because of poor grooming	1		1
Suspended from school		1	1
Joined military service	1		1
Unsatisfactory	6	1	7
Prolonged illness	1		1
Personal problem		1	1
Quit school	1		1
Unknown reasons		1	1

Table 2 indicates that the reasons students in the experimental group and in the control group gave for withdrawing from the DE II course were similar. It is noted that "unsatisfactory" was the chief reason for withdrawals in the experimental group and "change of career goals" was the main reason for withdrawal in the control group.

TABLE 3

STANDARDIZED TEST SCORES

EXPERIMENTAL GROUP VS. CONTROL GROUP

Group	Mean	Median	S.D.	S.E.	Mean Difference
OTIS QUICK SCORING MENTAL ABILITY TESTS I. Q. Scores					
Experimental	98.32	96.06	8.85	1.17	Not significant
Control	98.63	99.57	9.75	1.35	

TABLE 3 (CONTINUED)

Subject & Group	Mean	Median	S.D.	S.E.	Mean Difference
SEQUENTIAL TEST OF EDUCATIONAL PROGRESS Converted Scores					
Reading:					
Experimental	270	277	16.15	2.14	Significant
Control	282	282	13.70	1.90	
Listening:					
Experimental	281	281	11.15	1.48	Not significant
Control	283	282	11.30	1.57	
Mathematics:					
Experimental	266	265	10.50	1.39	Not significant
Control	268	270	12.05	1.67	

Table 3 shows the initial mental ability scores and certain academic achievement scores computed for the experimental group and for the control group. Reading achievement is the only one of four tests on which the mean difference for the two groups is significant. Students in both groups were below the 50th percentile in reading, listening and math ability. The mean reading scores of the experimental group indicated a significant reading disability.

TABLE 4

KUDER PREFERENCE TEST

Interest Rankings at the Beginning of the Study

	MALE STUDENTS		FEMALE STUDENTS	
Area	Experimental Group	Control Group	Experimental Group	Control Group
Persuasive	1	1	1	2
Clerical	2	2	3	7
Social Service	3	8	2	1
Artistic	4	3	5	3
Computational	5.5	4	4	8
Literary	5.5	5.5	10	9
Musical	7	7	9	10
Mechanical	8	10	6	6
Scientific	9	5.5	7	4
Outdoor	10	9	8	5

Table 4 shows how the interests of students, both male and female, who took DE I compared with the interests of students who had not had DE I. Number 1 indicates the area of highest interest and Number 10 shows the area of least interest.

Spearman's rank order correlation formula gave a coefficient of .72 for male students and a coefficient of .67 for female students. These correlation factors indicate that the occupational interests of boys in the experimental group and in the control group as well as girls in the experimental group and in the control group were significant. It is noted that there was a difference of 3 or more points in interest ranking between male students in the experimental group and in the control group in the areas of "social service" and "scientific." The greatest difference of interest for female students is noted in the area of "clerical," "computation" and "scientific."

TABLE 5

GORDON'S OCCUPATIONAL CHECK LIST

Interest Rankings at the Beginning of the Study

	MALE STUDENTS		FEMALE STUDENTS	
Area	Experimental Group	Control Group	Experimental Group	Control Group
Business	1	5	1	1
Technical	2	1	4	5
Outdoor	3	3	3	3
Artistic	4	4	5	4
Service	5	2	2	2

Table 5 shows how students both male and female who had DE I and those who did not have DE I ranked their interest in five vocational areas. Number 1 indicates the area of highest interest and 5 indicates the area of least interest. An application of Spearman's formula to these rankings gave a coefficient of minus .30 for male students and a coefficient of .98 for girls. The coefficient for male students (minus .30) indicates a fair degree of disagreement while the coefficient for girls (.98) indicates a very high and significant agreement of interest on the part of girls in the two groups. There was a great difference of interest on the part of male students in "business" and in "service" while there was very little difference on the part of girls in any area.

TABLE 6

DISTRIBUTIVE EDUCATION ACHIEVEMENT SURVEY

EXPERIMENTAL GROUP VS. CONTROL GROUP

Group and Time	Mean	Median	S.D.	S.E.	Mean Difference
Experimental					
Fall	18.91	19.46	3.42	.45	Significant
Spring	20.21	20.35	3.13	.41	
Control					
Fall	18.28	18.72	2.84	.40	Significant
Spring	19.84	20.10	3.45	.48	
Time and Group					
Fall					
Experimental	18.91	19.46	3.42	.45	Not significant
Control	18.28	18.72	2.84	.40	
Spring					
Experimental	20.21	20.35	3.13	.41	Not significant
Control	19.84	20.10	3.45	.48	

Table 6 shows that students in both the experimental group and in the control group performed significantly better on the Distributive Education Achievement Survey after a year of instruction.

Additional comparisons indicate that there was no significant difference in the understanding of the experimental group and of the control group on the fall test and no significant difference between the achievement of the two groups on the spring test. Thus mean differences were significant within groups but were not significant between groups.

TABLE 7

TEACHER MARKS

EXPERIMENTAL GROUP VS. CONTROL GROUP

Group and Time	Mean	Median	S.D.	S.E.	Mean Difference
Experimental Group					
First Semester	2.26	2.29	.68	.09	Significant
Second Semester	2.54	2.65	.82	.11	
Control Group					
First Semester	2.20	2.20	.73	.10	Significant
Second Semester	2.58	2.59	.94	.12	

TABLE 7 (CONTINUED)
TEACHER MARKS
EXPERIMENTAL GROUP VS. CONTROL GROUP

Time and Group	Mean	Median	S.D.	S.E.	Mean Difference
First Semester					
Experimental	2.26	2.29	.68	.09	Not significant
Control	2.20	2.20	.73	.10	
Second Semester					
Experimental	2.54	2.65	.82	.11	Not significant
Control	2.58	2.59	.94	.12	

Table 7 shows that students in both the experimental group and in the control group performed significantly better according to teacher marks after a year of instruction. The average marks for students in the two groups were converted to a five-point scale to facilitate statistical computation.

Additional comparisons indicate that there was no significant difference in the performance of the experimental group and of the control group either during the first semester or the second semester. Thus mean differences were significant within groups but were not significant between groups.

TABLE 8
RECOMMENDATIONS FOR JOB PLACEMENT

Group	Mean	Median	S.D.	S.E.	Mean Difference
Experimental	1.58	1.76	1.01	.15	Not significant
Control	1.95	1.66	1.52	.23	

Table 8 shows that students in the experimental group, those who had taken DE I prior to enrolling in DE II, were not recommended for job placement at a time that was significantly earlier than those students who had not taken DE I. Numbers in this table represent months from the time school began in September until recommendation for job placement by the teacher.

TABLE 9

COMPARISON OF STUDENT PROGRESS REPORT, STATE FORM DE 12

EMPLOYER RATINGS FOR EXPERIMENTAL GROUP

Characteristics	Mean	Median	S.D.	S.E.	Mean Difference
Appearance					
First Rating	11.84	11.31	2.02	.36	Significant
Third Rating	12.65	12.86	1.73	.31	
Personality					
First Rating	10.74	10.39	1.93	.35	Not significant
Third Rating	11.58	11.45	1.54	.28	
Enthusiasm					
First Rating	10.55	10.69	2.81	.51	Not significant
Third Rating	10.97	11.28	2.63	.47	
Cooperation					
First Rating	11.26	11.12	2.39	.43	Not significant
Third Rating	11.84	11.62	2.17	.39	
Reliability					
First Rating	11.35	11.33	3.17	.57	Not significant
Third Rating	11.87	11.80	2.62	.47	
Initiative					
First Rating	10.31	10.00	3.23	.58	Not significant
Third Rating	10.81	11.12	2.67	.48	
Judgement					
First Rating	10.32	10.31	2.36	.42	Not significant
Third Rating	10.97	11.14	2.72	.49	
Attendance					
First Rating	13.35	14.53	2.44	.44	Not significant
Third Rating	13.06	13.60	2.09	.38	
Punctuality					
First Rating	13.32	14.00	1.87	.34	Not significant
Third Rating	13.61	14.06	1.54	.28	
Production					
First Rating	7.65	7.18	2.74	.49	Significant
Third Rating	9.90	10.20	2.19	.39	
COMPOSITE					
First Rating	11.05	10.89	2.99	.17	Significant
Third Rating	11.73	11.76	2.51	.14	

Table 9 shows mean ratings for the first and third rating periods given by employers to the experimental group on ten characteristics pertinent to job performance. Number 15 indicates the highest rating on student progress and Number 1 indicates the lowest. Mean differences on "appearance" and on "production" were significant. The mean difference on "production" was significant beyond the .01 level. This table also shows that the composite mean difference for the third rating period was significantly higher than for the first.

TABLE 10

COMPARISON OF STUDENT PROGRESS REPORT, STATE FORM DE 12
EMPLOYER RATINGS FOR CONTROL GROUP

Characteristics	Mean	Median	S.D.	S.E.	Mean Difference

First Rating	11.13	10.34	2.48	.44	Not significant
Third Rating	12.13	11.83	1.81	.32	
Initiative					
First Rating	10.13	10.05	2.66	.47	Not significant
Third Rating	11.16	11.00	2.30	.41	
Judgement					
First Rating	10.91	10.25	2.43	.43	Not significant
Third Rating	11.75	11.30	2.18	.39	
Attendance					
First Rating	12.69	14.00	2.90	.51	Not significant
Third Rating	13.19	14.00	1.98	.35	
Punctuality					
First Rating	12.94	14.00	2.25	.40	Not significant
Third Rating	12.91	13.75	2.23	.39	

TABLE 10 (CONTINUED)

COMPARISON OF STUDENT PROGRESS REPORT, STATE FORM DE 12

EMPLOYER RATINGS FOR CONTROL GROUP

Characteristics	Mean	Median	S.D.	S.E.	Mean Difference
Production					
First Rating	8.56	7.50	2.81	.50	Significant
Third Rating	9.97	10.17	2.45	.43	
COMPOSITE					
First Rating	11.01	10.34	2.59	.13	Significant
Third Rating	11.89	11.59	2.24	.13	

Table 10 shows mean ratings for the first and third periods given by employers to the control group on ten characteristics pertinent to job performance. Number 15 indicates the highest rating on student progress and Number 1 indicates the lowest. Mean differences were significant in four out of ten cases. The composite mean difference for the third period was significantly higher than for the first.

TABLE 11

COMPARISON OF STUDENT PROGRESS REPORT, STATE FORM DE 12

EXPERIMENTAL GROUP VS. CONTROL GROUP

COMPOSITE SCORES

Rating Period & Group	Mean	Median	S.D.	S.E.	Mean Difference
First Rating Period					
Experimental Group	11.05	10.89	2.99	.17	Not significant
Control Group	11.01	10.34	2.59	.13	
Third Rating Period					
Experimental Group	11.73	11.76	2.51	.14	Not significant
Control Group	11.89	11.59	2.24	.13	

Table 11 shows composite mean scores on student progress ratings on ten characteristics pertinent to job performance. Number 15 indicates the highest rating on student progress and Number 1 indicates the lowest. The composite mean difference between the experimental group and the control group was not significant either for the first or for the third period.

TABLE 12

STUDENT PROGRESS REPORT, STATE FORM DE 12

CORRELATION OF EMPLOYER RANKINGS AND TEACHER RANKINGS

Characteristic	Employer Ranking	Teacher Ranking
Enthusiasm	1	1
Initiative	2	4
Cooperation	3	6
Judgement	4.5	5
Reliability	4.5	3
Personality	6	7
Appearance	7	8
Production	8	2
Attendance	9	9
Punctuality	10	10

Table 12 shows employer ranking and teacher ranking on ten characteristics pertinent to job performance as listed on the Student Progress Report, State Form DE 12. Number 1 indicates the most important and Number 10 indicates the least important characteristic. Teacher rankings and employer rankings of characteristics are very similar in eight of ten areas. Spearman's formula for rank correlation applied to these rankings gave a coefficient of .68 which indicates a significant agreement in ranking. Fairly wide disagreements (3 to 6 points) are noted between the opinions of teachers and of employers as to the importance of "cooperation" and of "production."

IV. Conclusions

1. The percentage of students who withdrew from the experimental group (those who took DE I) was 7½% less than for the control group (those who did not take DE I). This is a significant indication that students who took DE I prior to enrolling in DE II had a better understanding of the program and its value in helping to prepare students for vocational opportunities.

2. The vocational interests of students who had taken DE I and of those who had not taken DE I were significantly alike for both male and female students according to the Kuder Preference Test.

3. The vocational interests of male students who had taken DE I and of those who had not taken DE I gave a negative correlation according to Gordon's Occupational Check List, but it gave a high positive correlation for female students who had taken DE I and for those who had not taken DE I.

4. The DE variable did not effect significant mean differences between the experimental group and the control group in the following: (a) DE Achievement Survey Tests, (b) teacher marks, (c) the time that students were recommended for job placement, or (d) ratings on the Student Progress Report.

5. The DE variable did effect significant mean differences within the experimental group and within the control group in the following: (a) DE Achievement Survey Tests, (b) teacher marks, (c) and ratings of student progress for on the job training.

6. There was a significant agreement between teachers and managers as to the priority of the ten characteristics on the Student Progress Report, State Form DE 12; however, there was a considerable difference of opinion as to the importance of "cooperation" and "production" necessary in job training.

V. Recommendations

1. That a DE I course be available to all students in the tenth grade in order that they might have a longer period of time to determine their true interest in the field of distributive education and a longer period of time for adjustment to another vocational choice in case of a change in career goals.

2. That the DE I course content be examined to determine what changes are needed to provide students with motivation and a better academic preparation in the area of distributive education.

3. That State Form, DE 12,be studied to determine if there are characteristics that should be deleted or added to make the form a better measure of student progress.

4. That classroom instructors and employers get together on the local level to determine the priority of characteristics on the Student Progress Report Form in order that both parties may emphasize the values of the same characteristics.

5. That the Kuder Preference Test be used to help identify a student's broad interest area and, therefore, serve as a screening instrument for class enrollment in DE I and a guide to job placement.

6. That DE instructors and guidance counsellors, working together, carefully screen and adequately inform students as to the true purposes of the Distributive Education Program prior to enrollment in DE I.

FOREWORD AND ACKNOWLEDGEMENTS

The United States economy has moved from an agricultural emphasis, through a manufacturing era and into the present human resources era. Within the shadows of this latest development, a new occupational level is evolving in various types of industry -- technicians. The emphasis on the employment of technicians, who normally have post-secondary but sub-baccalaureate education, is recognition of a new occupational level in various types of industry. Technicians, as specialists, satisfy an important segment of manpower in the United States economy. They make significant contributions to research and development teams and they aid engineers in the design and production of various products. In addition, they are found in health-science and many other fields as key assistants to professional personnel.

To determine the need for such technicians in Michigan and their training opportunities, the Technician Need Study sought answers to basic questions. This was done through pre-planned and structured interview sessions with leaders in industry and education. There were many questions to which answers were desired. What is a technician? In what industry does he or she work? Where does a technician receive his or her training and is it adequate? How many technicians will be needed in the future?

The Technician Need Study was started in the fall of 1965 and completed in the early months of 1967. Representatives of various firms and industries were contacted and information was obtained through personal

interviews. Without the intense interest of these firms, and their cooperation in making effective interview arrangements, the Study would not have been possible.

Nothing is static including the demands of the labor market. These demands react to changing conditions and factors. The Technician Need Study itself became a factor in changing the concepts of many employers. In discussions of the needs for, and utilization of new technicians, interest and awareness of the occupations also were created. As a result, the present and projected needs of firms for technicians increased and expanded during the period the Study was in process.

The full report of the Technician Need Study has three broad goals: 1) to illuminate the present situation, 2) to describe anticipated increases in the needs for technicians, and 3) to report on educational programs which are available in the state. It is hoped that this summary report will stimulate the interest of counselors, educational planners, and manpower analysts to read the full report.

Acknowledgement is made in the full report of the significant contribution of the project staff members. However, their interest and involvement in the Study did not terminate when the Study was completed. Following the completion of their employment, they met occassionaly to review and to make suggestions regarding the summary. The professional staff members of the project were:

Barton W. LaBelle, Research Associate
James E. Cherry, Research Associate
Miss Vicki S. Waffle, Research Associate

Special acknowledgement is due the staff of the Office of Economic Expansion, Michigan Department of Commerce. They have not only maintained a keen interest in the Study itself, but also in the dissemination of information on study findings. The funding for this summary report and the Information Dissemination Seminars is due to the continuing and active interest of Mr. Bernard M. Conboy, Executive Director, Office of Economic Expansion.

James D. Kelly
Project Director

INTRODUCTION: STUDY EMPHASIS

Problems and Objectives

The Technician Need Study is an investigation of the present and future utilization of technicians in Michigan. As stated in the original project proposal the Study is concerned with obtaining answers to certain specific questions: 1) What is the extent of crucial manpower shortages in Michigan by technical area or skill, and the areas of occupation or industry, and to what extent will these shortages decrease or increase over the next few years in light of current trends? 2) What opportunities for technical training -- training beyond the high school level but less than the four year degree level -- are available now, and will be needed in the future to assure Michigan industry and business of an adequate supply of trained manpower?

In the Study, a technician is defined as an employee whose job required basic scientific and mathematical knowledge, or other specialized education or training in some aspect of technology, and who, as a rule, works directly with scientists, engineers, or other professional personnel. The technician is usually employed in job functions that require post-secondary education or its equivalent but below the baccalaureate level.

In accomplishing its objective, the Technician Need Study undertook to determine the present need for technically trained personnel in Michigan and to project this need relative to real or anticipated technological change so that such employment opportunities as exist, or may exist, can be filled by trained Michigan residents. Industrial growth and increased employment in Michigan will be determined in part by available resources, and

qualified technicians in sufficient number is an important resource.

The concern is not with the broad, general aspects of the problem, but rather with the particular and the specific. Counselors, curricumum developers, educational administrators, and manpower experts need the general perspective, but to deal with their everyday problems they must have detailed information. For example, there is need for specific information relating not only to the supply of and demand for the several types of technicians, but also to the educational requirements.

Scope of the Study

The Technician Need Study, through interviews and computed estimates includes a total of 1,218 firms from private industry with a total employment of 1,140,365. This is approximately 49 percent of Michigan wage and salary workers (excluding government and farm employment) as of January, 1966. In addition, the Study includes estimates for 94 hospitals; but both private and governmental units are included.

It is not possible to draw specific conclusions about the need for technicians in firms employing the remaining 51 percent of Michigan wage and salary workers. These firms are all of a different size, and primarily of a different type than those included in this study. On the basis of available information, the actual current and projected figures reported in this study represent minimum needs. Actual needs, in most classifications, are no doubt considerably higher.

The principal goal was to determine the needs in private industry. Therefore, except for hospitals, statistics were not obtained on technicians employed in governmental units -- federal, state, or local. Also, there would be more uniformity in the results obtained by excluding government, the largest service-type employer. However, in hospitals, the nature of the service provided is such that job functions for a particular occupational title would be similar in governmental and nongovernmental units. Hospitals were included irrespective of control -- federal, state, county, city voluntary non-profit, or proprietary.

Criteria for Inclusion. As used in the Study the term "firms" includes hospitals, industrial establishments, and service establishments organized on a profit or non-profit basis. They are classified by Standard Industrial Classification (SIC) code, as defined by the Executive Office of the President, Bureau of the Budget, and as used by the Bureau of Census. Although the level of manufacturing industry detail ranges from two-digit codes (major industry group) to seven-digit codes (products), most of the firms in this study are represented by four-digit Standard Industrial Classification (SIC) codes.

The selective, non-random sample of firms was based on number of employees and type of product. All firms employing 250 or more were included. However, it was assumed that producers and suppliers of certain products or services would have greater need for technicians. For these classifications the employment criteria for inclusion was below 250.

Several sources of data were used to determine the names of firms meeting the criteria. The major source of information on firms, other than hospitals and schools, was the Michigan Employment Security Commission which obtains information through reports from employers covered under the Michigan Employment Security Act. The information was made available under the provisions of Act No. 398 of the Public Acts of 1965. The data were arranged by Standard Industrial Classification and the number of employees of each employer unit.

Procedures

The procedures used in this study are discussed in detail in the full report. During a period of about 15 months, personnel in industrial and business firms throughout Michigan were interviewed regarding all aspects of technician need. The firms were selected on a non-random basis so as to obtain maximum coverage -- geographically, by type of industry, and as a percentage of the total labor force of the state. In some cases, firms with as few as 100, 50, 8, or even 3 employees were included. Hospitals, for several reasons, one of which relates to job functions, were treated somewhat as a special case.

Also, in the health occupation area, the needs emphasis was on actual current vacancies for which the employer was actively recruiting. The employer was requested to estimate future needs on the basis of an existing level of medical care and hospital facilities. This means that needs are stated on actual rather than desirable, standard of patient care to avoid obtaining information on shortages for a level of medical care and

hospital facilities that were not even in the planning stage at the time of the interview.

Assumptions. First, it was assumed that employers could answer best the questions relating to current employment, current vacancies, estimated needs for 1970, and other characteristics of technicians. The interview questionnaire therefore, was designed to aid the employer in pre-interview planning.

Secondly it was assumed that more valid information could be obtained from personal interviews than from other methods.

The third assumption was that a realistic picture of the present and future utilization of technicians in private industry and hospitals in Michigan could be constructed from interviews in a selective sample of from 700 to 1,000 firms.

Methodology. All firms meeting the criteria were sent a letter explaining the study and asking for their participation. These participation letters were directed to either the firm President or Personnel Director.

In addition to the individualized participation letter, medical and dental laboratories were sent a preliminary questionnaire which included definitions for the technical occupations associated with such laboratories. They were asked to complete and return the questionnaire to the study office. When this was received, a personal interview was scheduled at the laboratory.

Information sheets were enclosed with all participation letters. The information sheets presented essential data in an easy to read outline form.

The questionnaire and the definitions of job functions, condensed from the Dictionary of Occupational Titles, were included in participation letters.

The interview took place at the firms' offices. The length of interviews varied from one to five hours. On many occasions, the Study staff member talked with several persons. The firm representatives might include the personnel director, training director, research director, supervisory personnel, and/or technicians. During the interview, questions on the inadequacies of technical education were asked. Answers to these questions are an important part of the full report.

In large corporations, information was usually supplied at the corporate office. In addition, supplementary interviews were conducted at the divisional level to obtain information on educational requirements for technicians. It was believed that those closest to the work of technicians could best answer these questions. Interviews involved officials in a total of 688 firms. In addition, 31 supplementary information interviews were scheduled at the division level. The breakdown of interviews by SIC and employment is included in the Appendix of the full report.

Future Study Needs

No one study can provide definitive information on employment demands for technicians or the job functions they perform. With new technical occupations emerging, research must be continuous.

Community and other colleges should take the initiative for local interest studies. It is anticipated there will be increasing employer acceptance of technicians, and a corresponding expansion of training opportunities in the educational institutions and in the employers' educational facilities. Large firms will need to place additional emphasis on career planning.

The Technician Need Study delineates areas where additional research should be undertaken. One such area is the apprentice programs. The arbitrary elimination of journeymen in the manufacturing and machine trades from a technician classification is sometimes hard to justify when related instruction requirements of certain apprentice training programs and job functions of journeymen are examined.

SUMMARY OF STUDY FINDINGS

Table 1 sets forth by occupational group information furnished by employers interviewed. This tabulation shows, in percentage figures, present vacancies and projected increases in total employment of technicians.

TABLE 1

PRESENT AND PROJECTED NEED FOR TECHNICIANS EXPRESSED AS A PERCENTAGE OF CURRENT EMPLOYMENT[a]

Technician Classification Area	Need as a Percentage of Current Employment of Technicians

a. For employers interviewed -- Does not include computed estimates of need listed in Table 2.

There is general agreement among employers that the need for technicians will increase substantially during the next few years; also, there is a present unmet need for technicians in virtually every classification. The extent of the current shortage, as well as projected need, is presented in detail in the full report.

Technician Need Findings

The full report sets forth estimates of needs for specific technician classifications and the types of firms (SIC code) in which they are employed. The primary emphasis is on job functions as to a basis for the determination of needs by occupational titles.

In general, technicians receive more training in related theory than do craftsmen. However, their training is not as extensive as that of professionals with a baccalaureate or higher degree. Technicians usually become qualified through formal technical training, on-the-job training, or a combination of both.

In some firms it was difficult to identify all technicians. Some employers, by their definitions, classify as technicians only those in salaried positions, they do not include as technicians the hourly-rated employees in the employee bargaining units, even though they perform technician functions. These employers resisted efforts to get an evaluation of positions based solely on job functions and educational requirements. In general, outstanding cooperation was obtained from most employers. In some firms, more detailed information could have been supplied through visits to plants of the various divisions.

Estimates of Technician Need. The estimated need for technicians in 1970 was obtained by summation of data from two sources. Employer representatives projected their estimated need for technicians at the time of the interview. The reliability of these estimates vary with a firm's ability and interest in manpower planning; and a number of firms were unable to provide statistics on future need.

Secondly, the future need of each type of technician for firms not interviewed, but which met the Study criteria, was computed. Firms were grouped by Standard Industrial Classification Code. The total employment of firms not interviewed in each SIC code was divided by the total employment of firms interviewed and meeting the criteria in each SIC code. The resulting rate was applied to present employment of technicians, present technician vacancies, and projected total technician employment for 1970 in firms interviewed, to arrive at an estimate of technician needs in firms not interviewed. The method of computation is described in Appendix A of the full report.

Neither the employer estimates nor the computed estimates include technicians needed for replacement caused by death, retirements, or other attrition. As a result, the future need for technicians, as presented in Table 2 of this report, is undoubtedly conservative.

Employer estimates on classifications not listed in the questionnaire have been included under the heading "unclassified." Estimates were not made of present and future need for technicians in the "unclassified" category for employers not interviewed; that is, estimates for this group were made only for the classifications listed under occupational title difinitions that had been predetermined as significant for inclusion in the Study.

a. Data furnished by employers.

b. Computed. (See page 10 for brief description of method or Appendix A, Part 7, of full report for details on method of computation).

c. Estimates have not been made for the unclassified category of technicians.

Limitations. There are several factors limiting the Study findings. First, the Study does not attempt to estimate present and future needs for technicians in all Michigan firms. The Study is based on a non-random sample of firms; and technicians needs, as reported, are only for these and other firms which meet the level-of-employment criteria.

The statistics related to future needs for technicians are limited to the extent an employer was giving attention to the planning for manpower requirements. Individual firms vary in their emphasis on such planning. It has been assumed that the rate of adoption and implementation of automated processes will be such as to have only minimal influence on technician needs by 1970.

The Study elicited both objective information and subjective opinions from the interviewees. Characteristics of subjectivity should not conceal the value of such information. The employer places personnel in positions on the basis of abilities he believes are necessary for effective performance. Subjective though these opinions may be, they are real factors in the area of job placement.

Utilization of Technicians

The practice of employing trained technicians is relatively new to many firms of various sizes and types, and although many firms have been developing their own technicians, the programs are often informal and unsystematic. Therefore, the technician's education is frequently directed toward meeting the specific requirements of a particular firm rather than the broader scope of technical education per se.

An examination of recent manpower publications reveals an increasing emphasis in the whole area of technician manpower. Employers are becoming increasingly aware of the advantages of employing these trained specialists. If used wisely, the technician can serve to extend dramatically the productivity of the engineer, the scientist, or other professional. The concept of employing professionals and technicians to work as a team provides for maximum utilization of the talents and skills of both groups.

Present Needs and Deficiancies. The majority of presently employed technicians are young -- 20 to 30 years in age. Generally, they have had some form of post-secondary training prior to, or after employment. The scarcity of trained technicians is a barrier to more extensive use of these specialists. The overwhelming preference of employers is for specialized training prior to employment. Employers would like to see more post-secondary educational institutions develop good two-year occupational programs. However, educational planners, often find it difficult to plan a technical program that successfully avoids the extremes of excessive specialization of ambiguous generalization. The technician needs not only "tool" knowledge but also applicable general education.

Many small and medium-sized firms are unaware of the technician training programs available in post-secondary educational institutions. Furthermore, many employers are unaware of the extent of occupational readiness provided through "hands-on" skill development in the shops and laboratories of these schools and colleges. The emphasis on theory in

the classroom, together with simulated or actual experiences, provides those who complete these programs with the qualifications employers want. This type of training program is not generally appropriate for the "less able" student.

Inadequacies in the Education of Technicians

Many firms, because of the scarcity of trained technicians, are not in a position to evaluate present training programs. Instead they recommend what these programs should include. Interviewers encouraged responses to this question: "In what areas, if any, are available technicians inadequately trained?" The question includes the following subject-matter areas: English, writing, mathematics, science, industrial relations, technical skill, and other.

To obtain meaningful and usable responses, the interviewer supplemented the basic question with such items as:

1. If inadequate in English:
    a. Oral Communication or written?
    b. Difficulty in communication of ideas, direction, etc?
    c. Or the importance of impression they make?
2. If inadequate in writing: What kind of writing do they do (Examples)
    a. Technical reports?
    b. Fill out forms?
    c. Intra-firm communications?
    d. Creative-type writing?
    e. Persuasive writing?

3. If inadequate in mathematics:

   a. Is it a difficulty in applied or theoretical area?

   b. Do they need refresher courses in mathematics they already had? Or do they need to take advanced courses?

   c. What level of mathematics: algebra; geometry; trig; analytical geometry; Is advanced algebra necessary?

4. If inadequate in science:

   a. Difficulty in application of what they know? Or lack of theoretical knowledge?

   b. Physical or natural science?

   c. What area of science: biology; chemistry; physics?

   d. Is there difficulty with application of scientific method? Observation; analyzing; testing; etc?

5. If inadequate in industrial relations:

   a. Is there difficulty in relating to superiors or subordinates?

   b. Is there difficulty in communication: oral or written?

   c. Lack of knowledge of procedures to follow in supervising or carrying out directions?

   d. Lack of knowledge of company policies?

   e. What have been the two most significant reasons for failure to be selected for production supervisory positions?

6. If inadequate in technical skills:

   a. What do you believe educational institutions can do to correct this:

      (1) Relating to their courses?

      (2) Teaching methods (applied to theoretical)?

      (3) Relating to programs (reorganization)?

   b. Is the applied program and experience for the graduate of technical schools on the post-high school level relevant to the real job situation? Is more simulated experience needed?

   c. Is the technician unable to apply technical skill which he is assumed to possess? In relation to Ferris State College in particular--How many Ferris graduates within the firm?

For all technical occupations, employers agree that there are two areas of training which should receive added emphasis. These are English and writing. Although many employers emphasize the desirability of technical report writing in the technician's educational program, there was even greater emphasis on expository writing. In many cases, it would be desirable for the technician to have specific training in writing technical reports. Ability to communicate is of particular importance because the technician is frequently working with others as a member of a team and must be able to give, receive, and understand instructions. Other specific inadequacies, which relate to particular areas of specialization, are reported in the appropriate chapters of the full report.

In table 3, employer responses have been grouped and arranged by occupational area. The responses are indicated 1, 2, 3 in descending order of employer concern regarding the currently employed technicians' inadequacies.

Training Opportunities

As indicated elsewhere in the report, one of the objectives of the Study was to determine what opportunities were available for technician training. The findings for this objective are the basis for most of the recommendations made in the full report and restated in this summary report. Satisfying present and future needs requires interested, potential students and the necessary training opportunity. The opportunities involve both the existence of employer sponsored in-service training programs and post-secondary educational facilities.

As Seen by Employer. Employers are faced with two problems in the search for trained technicians. First, there are not enough graduates of occupational programs to meet the demand. And second, for some specialized occupations, there are no training programs available. Firm representatives made frequent references to the lack of industrial technician programs at their local community colleges.

Cooperative programs are held in high regard by all types of firms, especially when the industry training is an extension of the classroom and laboratory education discipline. There is no substitute for the experience the student gains in a work situation. Although it might be classed as a secondary benefit, the values of increased communication between school and industry should be appraised.

The relationships between schools and industry are further enhanced through tuition-refund programs. Many firms provide the opportunity for their employees to take work-related courses with the firm reimbursing part or all of the tuition expense. These employee-students are enrolled in practically every private and public educational institution in Michigan. Some of the courses most frequently taken through truition-refund programs are: drafting and design, mechanical engineering, supervision, and industrial engineering.

As Seen by Educational Institutions. Post-secondary educational institutions in the metropolitan areas are being encouraged to set up a number of technician training programs to meet industry needs. In areas with less industrial density, education officials expressed various levels of

concern for employer needs. In some institutions, there was only superficial recognition. In other areas, the educational officials expressed concern and looked to opportunities for additional offerings of programs for industrial technicians when initial or additional dormitory facilities were completed for in-residence students.

There is a significant trend toward related instruction at the college level for apprentice training programs, especially in manufacturing and machine trades. The increased number of community colleges made such a trend feasible. Such related instruction also has an impact on the future supply of technicians, as many apprentices develop an interest in continuing their education, at least through the associate degree level.

During the course of this Study, no attempt was made to obtain information on enrolments in institutional training programs under the Manpower Development and Training Act. While such programs may develop a person's initial interest to attain technician status, especially in the drafting, mechanical, electrical and some health occupation fields, the decreasing emphasis on institutional type training, may limit the contribution of such programs to the future supply of technicians. In addition, many who have completed such training are already in the labor market and are presummed to be included in the information furnished by employers.

Recruitment

Employers use several sources and methods to recruit technicians. The major source of technicians is up-grading of existing employees. When firms go outside their organization to recruit technicians, they use newspaper ads, employment agencies (private and public), and/or educational institution placement offices. Employers have only recently begun to recognize community and other colleges and technical institutes as a source of technicians. Some community colleges deter employers in their recruitment efforts by not providing a placement service.

Table 4 summarizes information furnished during interviews on enrolments in existing programs and the number of programs planned in post-secondary educational institutions. The enrolments will not meet employer manpower needs set forth earlier in this summary report. However, the availability does indicate a source for recruitment. Also, the limited enrolments in certain programs may indicate that employer recruiting activities could be broadened to assist educational institutions with their program feasibility problems. Employers with needs for trained technical manpower could help their situation by actively recruiting students for the school or college.

Programs[b]	Number of Programs[c]	Number of Enrollees[c]	Number of Additional Programs Planned
I. SUMMARY: TECHNICIAN NEED, OCCUPATIONAL PROGRAM AND ENROLMENT DATA			
1. Total Programs in all areas 1966-67 school year	158		
2. Total Enrolments all programs		9,094	
3. Total Additional Programs planned			128
4. Technician Need from Table 2			
a. Total Requirements 1970[d]		106,960	
b. Additional 1970 needs only		20,939	

a. Data furnished by 29 public and one private post-secondary educational institution in Michigan.

b. Unclassified technician category in each of the areas includes programs with curriculum content not easily identified with functional definitions for occupational titles used in study.

c. Programs and enrolment figures furnished at beginning of 1966-67 school year.

d. Requirements include current employment and vacancies plus projected additional need in 1970 excluding replacements for retirements, deaths, and other employment terminations.

Residual Effects of Study

While the Technician Need Study was in process, it became apparent that the Study itself was stimulating interest in, and an awareness of, technicians on the part of employers. The employer's awareness that there are occupational training programs for technicians affected his responses to several aspects of the Study. The continuation of this interest is hard to predict.

Many employers that currently utilize only a few technicians anticipate increasing needs by 1970. If these demands materialize, the gap between supply and needs will widen considerably. Educational institutions must make preparations now if severe shortages are to be avoided. An increased supply of trained technicians may cause an increased demand, at least over the short run, rather than a reduction of need. If this occurs, the projected needs presented in this report will fall far short of actual needs.

In many firms interviewed, an examination of job functions revealed to the employer that his educational requirements were not always realistic. In some cases, a baccalaureate degree was required for positions in which the job function could be performed by a technician. Although in some instances there was consideration for promotional opportunities, at other times the firm was expending money and time to train existing employees when recruitment of trained technicians would have been more profitable. In the long run, employers may examine the technician's place in their organization, and move toward more realistic educational requirements in terms of job functions to be performed.

Recommendations on the Basis of this Study

Industry's requirements for technicians can be met only through the availability of informed and interested young men and women who will take advantage of training opportunities. Some employers expressed difficulties in the recruitment and selection of qualified persons for their apprenticeship programs. Officials in educational institutions expressed a critical need for additional students in some occupational programs desired by employers. Educational officials, in areas with limited industrial employment opportunities, were optimistic regarding the possibility of increased enrolments in technician programs when initial or additional residence facilities were completed on their college compuses.

The summary of findings, points toward recommendations that emphasize the need for informed and interested young men and women able to meet the future demands for technicians. Opportunities for training must be provided by employers or post-secondary educational institutions.

Possible Courses of Action. Nine distinct but related recommendations are set forth for consideration by employers and educational institutions. The primary theme of meaningful and realistic communication practices transcend all the recommended courses of action.

1. More intensive and extensive channels of communications should be developed between the educational institutions and employers of their graduates. The inadequacy of present communications was evident from the employer's lack of awareness of available sources of needed personnel

and from the lack of programs in educational institutions to fulfill essential personnel needs of employers. The communication practices can be of many different types, among which could be:

a. Designated faculty representative to make continuing contacts on a scheduled basis.

b. The use of faculty members for vacation replacements.

c. An exchange program wherein both the college and employer needs are emphasized in selection criteria and job requirements that provide for employer representatives to serve as instructors and the college faculty members to serve as the replacement during a specified period corresponding to the school terms.

d. Area workshops for management employees and school faculty members that utilize employer and college representatives as discussion leaders.

2. Industry officials and school administrators should, together, provide opportunities for high school and post-secondary counselors to develop a more realistic concept of a "technician." Counselors should be more aware of what technician occupations exist and of the job functions associated with each occupation. The lack of interest some counselors may display for any post-high school education program which is less than a baccalaureate level should be avoided.

3. Counselors should understand that technician training programs are not generally appropriate for the "less able" student. This, plus the fact that most technician training programs require at least average ability along with particular aptitudes and interests, was emphasized by many of the employers interviewed. Not everyone is qualified by temperment and ability to be a technician. All characteristics of the student should be considered.

4. Employers, almost unanimously, recommended that administrators and faculty at post-secondary institutions should take the initiative for the development of additional cooperative educational programs for technicians. Employers generally agree that these types of training programs are invaluable. Certain aspects of the work situation are often beyond simulation in the classroom. Financial aid to the students and increasing contact between employers and educators are secondary benefits. In addition, employers emphasized the need for a coordinator of cooperative education on the college staff.

5. In those community colleges where such programs are not presently offered, the administration and faculty, with representatives of industry, should thoroughly study the opportunities and the feasibility of providing related instruction for apprenticeship programs in the manufacturing and machine trades. In addition to the college serving industry directly, the opportunities for post-secondary technical education becomes known to the apprentice. Employers emphasized the need for open-ended related instruction in apprenticeship programs as a method of meeting their future need for technicians.

6. Community colleges with resident (dormitory) facilities should examine the feasibility of additional programs for technical training. The regional nature of their student body would provide opportunity for a sufficient number of graduates that could meet not only local industry needs but also assist in meeting the technician needs elsewhere in Michigan.

7. Employers lack of information relating to on going technician training programs suggests community colleges with occupational programs should study the operations of their placement service. In those colleges where such a service has not been provided, the total range of benefits and costs should be examined to determine the feasibility of placement office functions.

8. Educators and employers alike urge that more technician training programs be developed around the core-curriculum concept. Many different meanings are attached to the "core" ideas which are currently used by employers and educational institutions. To the employer, it means a minimum of detailed specialization in any one particular classification in an occupational group, such as drafting and design related or electrical and electronic related. For the educational institution, the core idea involves curriculum planning wherein the first year of post-secondary has subject requirements common to many specialized occupational titles; for example, those found in the health related area. The training for many technical classifications is applicable to this approach. Core-curriculums reduce duplication during the first year and at the same time increase the occupations for which training is available.

9. Curriculum development personnel should determine the types of firms in which the greatest need exists for certain classifications of technicians. Thereafter, arrangements could be made for a detailed study of job functions in those firms located in the area served by the educational institutions. The full report of the Technician Need Study includes tables which present percentage breakdown for total technicians found in certain types of firms.

*INDUSTRIAL TRAINING; *SPECIALISTS; *EMPLOYMENT QUALIFICATIONS; *LEADERSHIP RESPONSIBILITY; ADMINISTRATIVE ORGANIZATION; *FOREIGN COUNTRIES; OCCUPATIONAL INFORMATION
ENGLAND

Training employees in any company is primarily the responsibility of management. Company managements, however, need guidance from training specialists including training officers, training development officers, group training officers, and training instructors. The primary function of the training officer is to advise management on formulating training policy at all levels and to assist in carrying them out. His contribution to company training stems from his knowledge of the training problems in all departments and of training techniques and methods. The training development officer has similar advisory responsibilities but to the industrial organization. He advises the organization on planning training arrangements at the industry level and assists in their implementation at company level. The functions of the group training officer are similar to those of the training development officer. He has an advisory function to a group management committee as well as to the management of individual companies. He is responsible for operating the training schemes. The effectiveness of any training program depends ultimately on the quality of the instructors applying it. They are responsible for putting training courses into effect at the actual level of instruction. A description of the general responsibilities, functions, and qualifications of each training specialist is provided. (HC)

SECTION I

Introduction

THE prosperity of this country and of its industries and companies depends to a large extent upon the most economic and efficient employment of our manpower for production and distribution. No industry can, however, expect to achieve this degree of efficiency unless it is prepared to assess thoroughly its future requirements of different categories of workers with varying types and degrees of skill. This requires an assessment of the present pattern of employment: and of such other factors as current wastage; future trends in the industry, including technological developments which might affect the type or level of skill required; and the likely expansion or contraction of the industry. Upon this foundation, flexible training policies can in turn be formulated which are closely related to economic needs and technological developments, and which will ensure that the numbers of employees being trained are sufficient to meet the requirements for different categories of manpower in the industry.

The implementation of training policies must ensure that greater efficiency is achieved by increasing the skill and flexibility of all employees, and this can only be done through appropriate systematic training. Modern training methods can produce better results in shorter time and so reduce the overall cost of training as well as producing better quality of work, higher output, reduced labour turnover, easier recruitment, greater adaptibility of workers, more efficient use of machinery and methods, reduction of accidents, and a general improvement of industrial relations.

This is one of the keys to increased productivity. The full value of capital investment, new methods and new machines cannot be realised unless everyone is trained to do his job in the most efficient manner.

More and better arrangements are therefore needed for training and further educating young people in all industries; similarly, systematic training methods must be applied to the retraining of adult workers where this becomes necessary due to mechanisation and other technological changes in production methods.

Training is the direct responsibility of management in every company but it must follow clear-cut Board policy. This in turn must be based upon detailed assessments of future needs in the light of all relevant factors including a full understanding of the most modern approaches to efficient and appropriate training.

In the formulation, and, particularly, the execution of a training policy, company managements will need to seek detailed advice from training specialists of one kind or another. These may be employed as such in individual companies, or may be available from an industry or local body such as an employers' organisation, joint body or group training association. There is a growing need for such properly trained specialists—training officers, training development officers, group training officers and training instructors—particularly in view of statutory provisions for industrial training.

This booklet is mainly concerned with those people who will be called upon to provide specialist advice on training at all levels, and its aim is to highlight the need for more training specialists of every type and to examine the roles and functions of the different categories, and the qualifications and training which they will require to perform those functions in the most efficient manner.

This is an urgent problem calling for immediate thought and action by every industry and by each company. It is hoped that this booklet will be of value in indicating to employers' organisations, joint bodies and individual companies the considerations which should be borne in mind in planning the recruitment and training of these key personnel, who will be required in increasing numbers over the next few years.

SECTION II

The Training Function

TRAINING for all categories of employees in any company is primarily the responsibility of management. In whatever department—research, production, sales or administration—the line manager is responsible for planning for his future manpower requirements, and, in doing so, he must consider what training will be required and how it is to be given.

Company managements will, however, need guidance from the centre of their industries to assist them in discharging their training responsibilities. Some industries have established central training departments providing such guidance on education and training matters, even down to detailed syllabuses of training for categories of workpeople common to all companies in the industry, and these services have been of considerable help and encouragement to managements.

The ways in which training is planned and provided will vary according to the size and resources of the company concerned, but any training scheme which is to achieve the object of turning out properly trained and adaptable workers must be based upon sound fundamental principles which go to make up systematic training, including:

(a) **Planning,** to determine, for as far ahead as possible, the company's training needs and priorities in terms of the different jobs to be done and the numbers of people required to do them.

(b) **Analysis** of the skills and knowledge required to do each job in order to determine what has to be taught; to clarify the purpose of a training course and the standard of attainment to be achieved at the end of it; to estimate training requirements in terms of space ,machines, instructors and materials; and to indicate the necessary pre-training requirements of trainees.

(c) **Preparation of a recruitment and selection programme** to place applicants in the right jobs at an early stage by matching their qualifications to the requirements of the job.

(d) **Drawing up of a written training programme** based on the job analysis, setting out, for the information of managers, instructors and trainees, exactly what has to be taught and learned, when, how and in what time.

(e) **Designing of a suitable training course** based on the written programme and couched in the form best suited to the circumstances of the industry, the company and the jobs concerned. All such courses, whatever their content or length, should have four broad divisions:

(i) *Induction,* or a short period of introductory training about the industry, company and job the trainee is entering, which may be interwoven with

(ii) *Basic training,* or intensive tuition in the basic skills and knowledge of the job;

(iii) *Planned experience:* a period in which the basic training is either applied systematically to working conditions or leads on to further training in one or more specialised jobs;

(iv) *Further education* which, whether vocational or non-vocational, will complement and be integrated with the training carried on within the company.

(f) Selection and training of intructors, who determine to a large extent the success or failure of a training scheme, and who must be both skilled at the job to be taught and possess the techniques and personal qualities to impart the required knowledge and skills to others.

(g) Vesting the responsibility for training within a company in a senior executive and organising the necessary internal control and co-operation on training matters.

(h) Provision of administrative arrangements for reviewing the traning scheme and the detailed content of training courses, and for recording the progress of trainees.

To enable effective schemes of systematic training to be carried out along these lines, training specialists as described in this booklet will be required in increasing numbers.

Detailed advice on the formulation of training policy, and on the execution of that policy, may in some companies be provided

by their own training officer. In smaller companies, which may make training the part-time responsibility of a senior executive, this detailed advice may be provided by a training development officer employed at industry level, or by a group trainng officer employed by a local association of companies for the purpose of running a group training scheme for its members.

For the implementation of training programmes at the point of instruction full-time instructors may be employed, or alternatively, managers, supervisors or skilled workers, who have been specially selected and trained in instructional techniques, may be employed part-time on teaching duties.

The following sections of this booklet describe the ways in which training specialists can assist managements in carrying out their responsibility of designing and providing proper training arrangements for their workpeople, and suggest the qualifications, experience and training which the specialists themselves require.

SECTION III

The Training Officer

IN COMPANIES which are large enough to employ their own training officers, the responsibilities and functions of these officers will of course vary according to the size of the company and the extent of its business and training activities. The job of the training officer as described below, is set out in terms of the various recruitment and training functions which need to be undertaken by most companies.

GENERAL RESPONSIBILITIES

THE training officer may be required to deal with training problems at any level of a company, including those concerned with the training of operatives, apprentices, technicians, technologists, clerical staff, supervisors and managers. His primary function is to advise management on the formulation of training policy at all these levels and to assist them to carry it out.

However much the exercise of the training function may be delegated to a training officer, management must not evade responsibility for it. Its place in the company organisation and the nature of line managers' responsibility for training carried out in their own departments should be clearly defined, and the role of the training adviser conveyed to all managers in the company. Even though he may, in larger companies, undertake many executive functions such as the running of a training department, the training officer's advisory role remains extremely important, and his contribution towards the agreement, at board level, of company training policies stems from his knowledge of the training problems in all departments and of training techniques and methods.

In order to provide advice to management, the training officer should be directly responsible to a senior executive, and he must ensure that all the available facts are submitted for consideration in the formulation of these policies. These will cover such subjects as :

(a) The assessment of the company's training needs and the establishment of priorities. The statistics which have to be considered in such an assessment are the numbers employed

in the company in different categories, i.e. apprentices, learners, craftsmen, semi-skilled and unskilled workers, supervisors, etc.; the numbers required annually to provide replacements in different occupations due to such causes as death, disablement, retirement, promotion, transfer and dismissals; changes in numbers employed due to expected expansion or contraction of the company's activities; redundancies likely to be caused by technological changes in production methods, which may in their turn call for retraining; and internal training needs which may be revealed by such symptoms as high labour turn-over, inferior product quality, inefficient use of machinery and techniques, recruitment difficulties, etc.

(b) The ages, levels of attainment and qualifications of young people finishing their full-time education who are available to fill vacancies in the company.

(c) The availability of trained labour locally, from both short and long term points of view, which may have a bearing on the introduction of internal or external training courses.

Where an industry organisation is able to provide statistics and advice on training matters it will also be advisable to consider such facts as:

(a) National or local supply of skilled workers, technicians and technologists, which may throw more emphasis on the industry's need to train its own technical experts.

(b) The industry's training policy with particular reference to the various matters dealt with under existing training legislation.

(c) National training schemes in the industry for different categories of workers.

(d) The need for opportunities for systematic training according to the nature of the job to be provided for young people entering their first employment.

(e) The implications to the company of current developments in the field of industrial education and training both inside and outside the industry.

PARTICULAR FUNCTIONS

AFTER the company's training policy had been formulated, the training officer's responsibility is to see that this policy is effectively carried out, and the preparation of training programmes is a

central feature of his job. To do this successfully he must first make use of his assessment of the company's training needs, in the light of which he must then arrange for the skills and knowledge required in each main occupational category to be analysed to help him in the detailed work of programme planning.

Analysis of Skills and Knowledge :

BEFORE training programmes can be planned, at whatever level of training, comprehensive statements of the skills and knowledge required in each job should be prepared. A training officer does not have to be expert in the techniques of method study and job analysis, but, if he is to be able to convince others of its necessity in the work of designing training programmes, he should have a good working knowledge of the techniques involved. The actual analysis might be done in the department concerned, or it may be necessary to commission the work study department to perform it. In smaller companies where staff may not be available to carry out these analyses, it may be necessary to use outside agencies such as the industry's central training department or a group training officer.

In many operative jobs, manual skills will predominate and have to be studied in detail, while the knowledge required for the job may be small. In other types of jobs the reverse may be the case, and the emphasis will be almost entirely on studying the knowledge requirements. Job analyses of the more highly graded posts may have to be carried out on an individual basis, and performance on the job may not easily be measured in quantitative terms. For this purpose, the training officer should understand modern methods of personnel assessment.

Preparation of Company Training Programmes :

(a) *Internal Training in the Company:* A statement of the skills and knowledge required for a job is the essential basis upon which the training officer can start to prepare his training programme. Although programme planning is, in itself, a technique employed by the training specialist, this should be done in close co-operation with the managers directly concerned in each department.

A training programme should normally consist of a syllabus, a set of instruction plans, and a timetable. The syllabus will list the skills and knowledge to be taught in the correct sequence, laying down in broad terms the amount of time to be devoted to each part. This forms the main

outline of the training programme, and the training officer should then select and employ the training techniques most appropriate to each stage of the training. In large companies this may involve him in the design and lay-out of training centres, and the choice and ordering of equipment. His knowledge of the way in which people learn will enable him to determine the order in which information should be presented, the time required and the appropriate method of instruction. This will form the basis of the detailed instruction plans for each part of the syllabus. Finally, the timetable should be produced, setting out the teaching programme hour by hour and week by week.

(b) *Further education:* Further education should form an essential part of industrial training, providing complementary information and background knowledge to improve the performance of particular jobs. It is management's responsibility to ensure that appropriate further education courses are properly integrated with the company's internal training programmes. The Council has recommended that all young people at least up to the age of 18 should be given day release facilities, or their equivalent, for attendance at such courses.

The training officer must, therefore, keep in touch with the development of further education courses for different grades of staff with a view to advising management, and he may, in the case of larger companies, need to arrange for special courses to be run at local colleges to meet the particular needs of the company. He should also :

(i) decide how much external assistance the company will need and will be able to obtain;

(ii) ascertain the facilities which are available locally and assess the value to his company of available courses;

(iii) where suitable external assistance is unobtainable, organise internal courses, using, where possible, technical and commercial experts from within the company as teachers, instructing them as necessary in teaching techniques;

(iv) advise employees on the suitability of external courses in relation to their existing qualifications, experience and future prospects. In this he will need to be conversant with the entrance qualifications for the examination courses of different professional bodies;

(v) keep in close personal touch with principals and departmental heads of colleges with a view to the organisation of suitable courses for employees in the company and to keeping a check on the progress of those attending them.

Training for Instructors:

In putting a training programme into practice, it will be necessary for the training officer to see that those who will be required to instruct are properly qualified to do so, and trained in the techniques of instruction. This will entail:

(a) Determining the number of instructional staff needed, and whether they should be full-time or part-time.

(b) Assisting in establishing agreed specifications to be used in selecting instructors.

(c) Selecting instructors.

(d) Arranging for them to be trained, either externally or by training them himself.

(e) Where instructors have been trained externally, introducing them to the job and doing such follow-up training as may be necessary.

(f) Ensuring that instructors are kept up-to-date in training techniques and job knowledge.

Even where the training officer is able to arrange for all practical training to be done by part-time or full-time instructors, he must himself to be familiar with the practical side of industrial teaching so that he can evaluate the performance of instructors and ensure that the best standard of practical instructing is maintained.

The Administration of Company Training Programmes:

Having initiated a training scheme, the job of the training officer is to ensure that it is operating and running according to plan. These are some of the means by which he can do this:

(a) *Preparation of Training Manuals:* A manual of training for any job, consisting of a collection of all the documents required to describe the scheme and how it works, might include:

a job break-down;

fault analyses (where applicable);

statement on quality standards enforced;

syllabus;

set of instruction plans;

list of special devices and exercises;

record of targets used;

a timetable;

and a summary of selection procedure.

A list of equipment used in a training centre might also be included, together with copies of any record forms used in the control of training.

Normally manuals are developed over a period as a training scheme progresses, and they provide a permanent record of everything involved in organising training for a given job or range of jobs. They also provide a source of reference for junior training officers and instructors who may be directly concerned in the implementation of the training programme.

(b) *Record Systems:* The object of keeping training records is to provide information to management, the training officer and trainees themselves as to progress of individuals at any given time on the course. To this end, the training officer needs a simple system of records, which will ensure that essential information about trainees' progress is available when required. Advice may have to be given to supervisors and managers on assessing their trainees and completing assessment forms.

(c) *Practical Checks of Progess:* In addition to a record system, practical checks are necessary on the progress of trainees. Tests can be arranged at regular intervals throughout a training programme; regular visits should be made to trainees at their place of work in order to carry out spot checks on the training they are receiving; and trainees should be interviewed at regular intervals throughout the course to assess their progress and attitude.

Recruitment and Selection:

The ultimate success of any training course depends very largely on the selection of the right people to be trained in the first place. It is therefore important that the training officer should play his part in the setting of standards for selection and in the actual operation of the selection procedure. In some companies he combines the work of recruitment, selection and training.

The following are some of the ways in which the training officer may contribute to this process:

(a) Drawing up job specifications.

(b) Conducting or assisting at interviews.

(c) Advising on suitable ability and aptitude tests to be used, and administering them.

(d) Designing rating forms for use at interviews, and training others in their use.

(e) Determining the specialised training to be given to particular employees on completion of basic training.

(f) Liaison with the Youth Employment Service, schools, technical colleges and universities.

Budgeting for Training:

Training must be budgeted for in the same way as any other production or administrative activity in the company, and a calculation of the cost of the introduction and running of training programmes will also assist the training officer in keeping control of costs and checking the effectiveness of individual courses. Any financial estimate of this sort should, where circumstances make it possible, try to balance the costs of training against the returns obtained from improvements in productivity and other benefits brought about by that training.

Evaluation of Training Programmes :

The training officer will need to evaluate existing training programmes regularly so as to ensure that they are effective and up-to-date and that their objectives are being attained, and to take into account the attitudes to them of managers and learners.

SELECTING AND TRAINING THE TRAINING OFFICER

(i) Job Requirements :

The job requirements for training officers can be discerned from their responsibilities and functions described above.

A training officer should be knowledgeable about the structure and functioning of industrial organisations, and familiar with the management methods employed in the various departments of the company; e.g. production, sales, research and development, accounting and general administration. If he himself has held executive responsibility either in a line department or in some specialist department other than training, he will have a better

understanding of the problems confronting line management in training and allied fields. The training officer should also be able to exercise his communcation skills with just as much facility in the boardroom as on the shopfloor.

He should understand the techniques of the organisation and methods specialist in order to be able to study company and departmental training needs and to analyse jobs to determine the skills and knowledge in them.

He must have extensive knowledge of the theories of learning and of industrial training techniques and methods in order to be able to plan and design training courses and to select and train instructors to implement them. He must also have a thorough understanding of the country's educational system, with particular reference to further education.

The training officer should have a close insight into the human and industrial relations aspects of management to enable him to understand how training courses he may design can affect relationships in the company. He should be capable of taking part, if necessary, in any negotiations with trade unions which may arise over some aspect of training. He will require also a considerable knowledge of industrial psychology, especially in his activities in connection with the selection and placement of employees. In this, he will need to be familar with the use of selection tests and to be able to assess their practical value. He should also be experienced in the technique of interviewing, and should understand merit rating methods.

The control, administration and evaluation of training programmes are bound to involve the handling of a considerable amount of paperwork, and the training officer must therefore be an efficient administrator.

(ii) Qualifications and Experience :

IDEALLY a training officer should start from the basis of a university degree or professional qualification. This should ensure that he has sufficient breadth and depth of education and adequate mental flexibility to carry out his work. It would be an advantage if he had pursued some general course of management studies on completion of his technical or professional training.

An important additional quality required in a prospective training officer is that he should have a genuinely strong interest in the improvement of education and training methods, together

with the necessary personality, maturity and enthusiasm to carry this through.

(iii) Training:

PROSPECTIVE training officers might require a training course on the following lines to supplement their existing knowledge and experience:

(1) *Instruction in essential background subjects such as:*

Management Methods and Industrial Organisation;
Occupational Psychology;
Structure of the Educational System—Futher Education;
Industrial Sociology:
Personnel Management and Industrial Relations.

(2) *Instruction and practice in:*

Work Study and Skills Analysis;
Instructional Methods and Techniques;
Training Administration;
Interviewing and the use of Selection Tests.

(3) *Opportunities for project work, under suitably qualified industrial tutors, on such subjects as:*

Assessment of Training Needs;
Job Analysis;
Programme Planning.

Existing courses for training officers cover some of these matters, and sources of information about them are given in the Appendix.

In the future, longer and more formalised courses will be necessary, ranging from concentrated full-time courses of up to one year for training officers responsible for all aspects of training, to shorter *ad hoc* or sandwich courses.

It is important that courses for this purpose should be located at centres where close contacts with industry are possible, so that project work and practical experience in factories, shops or offices may be arranged as an integral part of the training. A substantial part of the course, which might be on a sandwich basis, should be devoted to this type of activity. Colleges of Advanced Technology, Regional Technical Colleges or Universities with close working relationships with industry would seem to be most appropriately equipped to provide courses matching these requirements.

The instruction on such a course should be given, as far as possible, by persons who have themselves had extensive experience of training in industry, and much of it by persons seconded from industry for that purpose.

For practising training officers, who may never have had any formal training for their job, shorter courses should be provided covering similar ground, but with shorter periods of practical experience. These courses should also be provided at Colleges of Advanced Technology, Regional Technical Colleges or Universities, and they might conveniently be run during periods when training officers on long courses are away from the college or university undertaking practical work.

All training officers should be encouraged to attend short supplementary or refresher courses from time to time dealing with particular aspects of industrial training such as methods of analysing semi-skilled jobs, planning of operative training, planning of apprentice training supervisory training techniques, etc. A number of courses of this kind already exist and sources of information about them are given in the Appendix. Training officers should also be encouraged to participate in professional and related association activities.

SECTION IV

The Training Development Officer

THE TRAINING DEVELOPMENT OFFICER, as distinct from the Training Officer, first made his appearance on the training scene in Britain after the war when plans were being formulated by some industries for the setting up of training arrangements and the provision of advisory services on an industry basis. A brief account of the services set up by various industries was given in the Council's booklet—*Training Services in Industry.*

This movement towards the appointment of such officers was further stimulated by the Carr Report and, particularly, by the Government grant-in-aid to the Council, which has enabled it to assist employers' organisations and joint bodies to appoint training development officers, and to establish a Training Advisory Service composed of such officers to assist industrial bodies and individual companies. Statutory provisions on industrial training will provide a further impetus towards the appointment of these officers.

GENERAL RESPONSIBILITIES

THE training development officer has similar advisory responsibilities towards the industrial organisation for which he works as the company training officer has to his Board of Directors. His functions are basically twofold:

(i) to advise these organisations on the planning of training arrangements at industry level:

(ii) to assist in their implementation at company level.

He is a consultant to companies in the industry and a specialist in training techniques and methods. From his central position, with the possibility of working in close association with many different companies in the industry, he is also able to bring about a wide exchange of ideas and experience on training matters.

The role of the training development officer has, of course, increased in importance with the development of industry training arrangements and with the growing provision of training services by employers' organisations and joint bodies, some of which have recognised that the effectiveness of their services is greaty enhanced

by the appointment of full-time officers who can devote their whole attention to the development of training in their industries. Such officers are an essential part of any co-ordinated effort to plan training from the centre of an industry.

PARTICULAR FUNCTIONS

During the "bulge" years, industry training organisations tended to be preoccupied with the drive to accelerate the expansion of apprenticeship and other industrial training for young people. The main job of the training development officer in that context was to stimulate and assist the setting up or extension of training schemes for young people by employers, either individually or through joint schemes. With the resulting increase in training activities, however, and particularly with the statutory provisions for training, the role and function of these officers have developed along broader lines.

Firstly, the training development officer assists industrial bodies to set up machinery for the regular assessment on a national basis of the training needs of the entire industry in terms of the skilled and lesser skilled workers required, with a view to ensuring that the numbers trained are sufficient to meet those needs. This necessitates taking into consideration, from the point of view of the industry as a whole, all the facts of which an individual company has to take account in formulating its training policy, as set out in Section III. In assessing future training needs in the light of these facts, account will need to be taken of future trends in the industry, including technological developments which might affect the type or level of skill required and the possible expansion or contraction of the industry.

Secondly, the training development officer advises industrial bodies on the possibility and means of analysing on an industry basis the various jobs and occupations common to most companies in the industry, in terms of the skills and knowledge required, as a basis for planning the appropriate training. Here full account has to be taken of the need for workpeople to become better fitted to meet technical changes in industry, which can be achieved by giving them a broader based training over a wider range of skills than at present.

This leads on to the third task of assisting in the establishment of industry training schemes for different categories of workers which set out standards of training on a national basis and appropriate syllabuses of training drawn up in conformity with those standards. To be effective such schemes should include guidance to companies

in the practical aspects, dealt with in Section III, of such matters as:

(a) The assessment of training needs of individual firms.

(b) The analysis of jobs and occupations.

(c) The planning of training programmes appropriate to the resources and facilities of particular firms.

(d) The establishment and application of training tests.

(e) The recruitment and selection of trainees.

(f) The selection and training of instructors.

(g) The administration and control of training programmes.

These are formidable tasks by any standard, but they are quite fundamental to any serious reappraisal of an industry's training arrangements and cannot be adequately undertaken without the advice and assistance of specialised staff.

However, the formulation of an industry's training policy and the preparation of national training schemes are not in themselves sufficient. It is essential that practical detailed guidance and technical and administrative help are made available to companies in the industry to enable them to put these schemes into practice.

The provision of this assistance at company level forms a major part of the training development officer's job, and he should make use of a variety of ways of doing this.

Firstly, general guidance on training problems can be issued in written form:

(a) *Booklets* dealing with one or more subjects, e.g. recruitment and selection methods, and principles of training relevant to the jobs and occupations found in the industry.

(b) *Job breakdowns,* where these are common enough to be generally useful, or as examples of how a breakdown should appear.

(c) *Detailed syllabuses,* showing subjects in which instruction or planned experience should be provided.

(d) *Sample programmes* of training for general guidance.

(e) *Training manuals* for particular jobs.

Secondly, such written guidance can be supplemented by conferences and courses:

(a) *Conferences* for management representatives or for training officers, supervisors, instructors, key workers and others

concerned with training, dealing with any of the above subjects.

(b) *Courses* for managers, training officers, supervisors and instructors dealing in more detail with any of the above subjects. Courses would be particularly relevant on such matters as instructional techniques and methods (for instructors) and job analysis for training purposes.

Thirdly, and perhaps the most effective method to be used by the training development officer, is the provision of consultancy/advisory services to companies at their own workplaces, to carry out for them some or all of the assessment, analysis, planning and other work connected with introducing or developing training.

Clearly for industries of any size, this work cannot be done by a single training development officer, but may need staff in proportion to the size of the industry, and may be organised on an area basis when convenient. Alternatively, some or all of the work may be done on a contract basis by specialist organisations such as the Training Advisory Service of the Industrial Training Council.

QUALIFICATIONS, EXPERIENCE AND TRAINING

While the training officer in a company normally works in an atmosphere where training has at least been accepted in principle, the training development officer is often required to move in an environment where lack of knowledge of the principles of sound training goes hand in hand with lack of appreciation of its economic and social advantages. His role therefore takes on a missionary character and has an element of salesmanship about it. As both a participant in the formulation of national training policy and one of its chief interpreters at the local level, he needs to be equally at home at the centre of his industry and with the management or on the shop floor of its various companies.

In addition to possessing the various technical qualifications, experience and know-how required of the training officer, the training development officer should have a clear insight into the background and general organisation of his industry, including its relations and agreements with the trade unions and its policies over the broad field of industrial relations, and be able to ensure as far as possible that, in the inner counsels of the industry, training considerations are given a fair hearing.

Ideally, a training development officer should also have worked for a period as a company training officer; have experience of

training work at all levels, and in more than one company; have a knowledge of the technology of the industry; be skilled at job-analysis and report writing; and be able to address audiences of all levels competently.

While part of the training necessary for a training development officer can be undertaken through the courses provided for training officers, much of it can best be carried out on the job in the atmosphere and at the different levels of the industry in which he is required to work.

The scope of the statutory provisions on industrial training will require the appointment of a number of training experts by the various industry Training Boards, and this will provide opportunities for the newly appointed training development officer to gain experience on the job by assisting and understudying those above him. There will also be a need for the organisation of special courses for training development officers.

SECTION V

The Group Training Officer

COMPANIES which are not large enough to justify economically obtain the advantages of having such a specialist in close and continuous contact with their problems by sharing the services of a Group Training Officer with a relatively small number of other companies in their neighbourhood through the medium of a Group Training Scheme. Such grouping might be from the same industry or from a number of different industries.

The responsibilities and functions of the group training officer are very similar to those of a company training officer. He may, however, have some additional tasks in connection with the administration of a group training scheme, and, in the formative stages of such a scheme, his role may be similar to that of a training development officer. In his preparatory work, his advisory function will be in relation to a group management committee as well as to the managements of each of the individual companies in the group. As the scheme develops, the group training officer will be responsible for operating its training schemes, and will therefore increasingly perform the duties of the company training officer.

The group training officer therefore requires a combination of the qualities and experience of the company training officer and some of those of the training development officer, and, in particular, he may require the ability to assess company training needs over a wide range of industries, together with communication and administrative skills of a high order.

As far as training is concerned, he should have undergone the formal training suggested for a company training officer, and have worked as such for a period. There will also be a need for further training covering the organisational and administrative problems involved in group training schemes, which may best be obtained by undergoing short courses and periods of planned experience with the training development service of one or more industries.

The organisation and administration of group training schemes and the work of the group training officer are dealt with fully in the booklet—*Group Training Schemes*—published by the Council's Training Advisory Service.

SECTION VI

The Training Instructor

THE effectiveness of any training programme depends ultimately on the quality of the instructors applying it. They are responsible for putting training courses into effect at the actual level of instruction, and are likely to be concerned with advisory work leading to policy making, although they may be required to provide information on various practical matters considered in the formulation of company training policy.

Where the volume of instructing to be done justifies the appointment of somebody engaged full-time on instructing, such a person is usually known by the title of Instructor or Instructress. The title of Training Officer or Training Supervisor is sometimes applied to these people, emphasising their full-time concern with this aspect of training. The full-time instructor may be responsible to the executive in charge of training in the company or directly to the management of the department in which he is working.

Where the volume of instructing is relatively small, or needs to be given only from time to time, persons normally employed as supervisors, skilled workers, senior operatives or possibly managers, may be used for a part of their time as instructors, and as such they will need the same qualifications, experience and training as those employed full-time on instructional duties.

DUTIES

THE scope and level of instructional duties vary in different companies, and, although the observations made on these duties in this section refers to the job of a full-time instructor working in a training centre for operatives or apprentices, they can equally well be applied, with modifications, to the part-time instructor on the shop floor.

An instructor is primarily concerned with the following:

(a) Direct instruction of learners, either individually or in groups, in the practical skills and knowledge they need in the performance of their jobs. He is the practitioner in instructional techniques and methods—telling, showing, illustrating, conducting practice, etc.

(b) Supervising practical work, correcting errors, stimulating interest and providing encouragement to individual trainees.

(c) Organising the hour-to-hour work of a training centre.

(d) Keeping detailed records of trainees' progress and presenting these to management in a comprehensive form.

(e) Maintaining custody of materials and equipment used for training.

In some cases, especially in smaller companies, the instructor may, in addition, be expected to undertake some of the duties of a training officer, such as:

(a) Preparing job breakdowns;

(b) Preparing instruction plans, visual aids and other materials to be used in training;

(c) Preparing timetables;

(d) Arranging for the transfer of trainees to production departments on completion of their training and following up their progress thereafter.

Ideally these functions should be carried out by a training development officer or group training officer.

QUALIFICATIONS, EXPERIENCE AND TRAINING

AMONG the many qualities which a good instructor should possess, the following are the most important:

(a) He should be skilled and knowledgeable in the job he is going to teach, including the safety aspects of it, though this does not necessarily mean that he should be up to the standard of the best or fastest operative.

(b) He must be competent and methodical in the application of instructional techniques and methods.

(c) He should have a sympathetic interest in people and their problems; this is particularly important where, as is usually the case, he is dealing with young people.

(d) He must have enthusiasm for his work.

These qualities and skills will help in the selection of the right people to be trained as instructors, but some of them cannot easily be taught to the mature adult worker who may be called upon to instruct.

Instructional techniques and methods are, however, skills which are capable of being taught and learned like any others. Training in these must be given, in relation to the subject which they are to

teach, to all who are selected to be either full-time or part-time instructors.

This training should include subjects under the following broad headings:—

(a) The role of the instructor;

(b) The nature of industrial skills;

(c) How and why people learn;

(d) The instructional techniques of telling, showing, illustration, question and answer, and discussion.

(e) The instructional methods of the practical lesson, the classroom lesson, the talk, the lecture, group discussion, role play, case study and project work.

(f) Choosing the right method of instruction and planning the lesson.

(g) Keeping training records.

Details of courses for instructors are given in the Council's booklet *Craft Apprenticeship—Training for a Skilled Craft or Trade*, and sources of information on these and other courses are set out in the Appendix to the present booklet.

TRADE AND INDUSTRIAL EDUCATION; *TRADE AND INDUSTRIAL TEACHERS; *TEACHER CHARACTERISTICS; TEACHER QUALIFICATIONS; *EDUCATIONAL BACKGROUND; *WORK EXPERIENCE; TEACHING LOAD; *AREA VOCATIONAL SCHOOLS; STATE SURVEYS; TEACHER EDUCATION; OCCUPATIONAL MOBILITY; EMPLOYMENT EXPERIENCE; CERTIFICATION
MINNESOTA

Questionnaires returned by 203 certified day-school trade and industrial instructors provided descriptive information for the State department of education and for planning instructor training programs. Findings included: (1) 46 instructors were female, (2) The median age was 43.3 years, (3) 11 had not completed high school, (4) 60 held a bachelor's degree, (5) 14 held a master's degree or its equivalent, (6) 158 had taken course work in the previous 3 years, (7) 75 had teacher education courses beyond certification requirements. (8) 141 had taken on-campus courses for off-campus credit, (9) 90 had participated in industrial workshops, (10) 50 had taken off-campus courses for credit, (11) 97 had been in some kind of apprentice program, (12) 84 were union members, (13) 22 belonged to an employers' or contractor's association, (14) The median trade experience before teaching was 12.45 years, (15) 8 had less than 2 years trade experience, (16) 161 were certified in only one area, (17) 150 taught both the shop and related information phases, (18) 129 indicated they had no free preparation time, and (19) Their median salary was $7,269. This is an independent paper submitted for Ind. 200 Research Problems at The University of Minnesota. (EM)

ACKNOWLEDGMENTS

The writer wishes to acknowledge the cooperation and help of the directors, instructors, and certain members of the State Department of Education, Vocational Division, with whom it has been a pleasure to work. Acknowledgments are due to Mr. Fred L. Gordon, State Director, and Mr. Robert Van Tries, Assistant State Director, Minnesota State Department of Education, Vocational Division, for their supporting interest in this study. The writer also wishes to thank the various area trade school instructors for their time in completing the questionnaire.

A special debt of gratitude is owed to my adviser, Howard F. Nelson, Professor and Chairman, Department of Industrial Education, University of Minnesota, for his patient, constructive criticisms, and valuable advice offered during the study. Special thanks also go the Mr. Harold T. Widdowson, Professor, Department of Industrial Education, University of Minnesota, for his help in the formulation of questions used in the questionnaire.

CHAPTER I

INTRODUCTION

I. PURPOSE OF THE STUDY

The writer became interested in the profiles of Minnesota day school vocational instructors while pursuing Minnesota Department of Education publications. These publications indicated concern with the industrial arts programs, the vocational day school programs in the State of Minnesota, and the certification of the instructors. The requirements for certification in the day trade vocational program vary a great deal. The certificates for vocational teachers were divided into two broad catagories. The first of these covered the trade shop teacher and the second group the related trade teachers. A trade shop teacher concerns himself primarily with teaching shop skills and the necessary related information. The related trade teacher teaches related subject areas that help to broaden the knowledge and basic educational background of the trainees. These subject areas were not necessarily required to perform a specific shop skill. The various certificates were renewable for specified lengths of time after earning

additional credits in teacher training courses. The certifications are described in greater detail in the part of this chapter under Definition of Terms.

After discussions with various people in the Vocational Division of the Minnesota Department of Education and those concerned with the training of the day school instructors it was found that there was very little statistical information available on these instructors. Characterizations and generalizations were made on age, trade experience, teacher training, earnings, and teaching experience. These generalizations were based on very limited information and led to invalid conclusions regarding the day trade school instructors. It was hoped that this paper would give a more comprehensive picture of the personnel that make up our instructional staff in the day trade program.

The writer and other interested parties desired to obtain a profile of the Minnesota day school trade and industrial instructors and thereby characterize these instructors. This study was designed to give a visual delineation of the instructors, provide aid in future planning of training programs for vocational instructors,

and furnish descriptive information relative to the vocational day school instructors to the Minnesota Department of Education, Vocational Division.

It was assumed that the salaries of the various instructors would vary to a great degree. Some of this variation could be attributed to the geographic locations of the schools. The writer thought it would be of value to find the average salary of the instructors, and therefore, provide a basis of comparison to the salaries of the men in the trades.

The salaries of the instructors should be commensurate to or greater than the salaries they could earn in the trade. Hawkins, Prosser and Wright stated that "the loss of teacher can be attributed to failure of the public school authorities to take into account salaries paid by other agencies and commercial concerns."[1] These authors went on to state, "The purpose of the various vocational acts in

---

[1]Hawkins, Prosser, and Wright, Development of Vocational Education (Chicago: American Technical Society, 1951), pp. 221.

reimbursement policy is to pay adequate salaries and thereby keep teachers."[2]

Another area the writer thought would be of interest was the use of training programs. A variety of training programs are available to the instructors to gain certification. It was hoped that by gathering information on the use of these training programs it would be possible to decide which programs were most frequently used by the instructors.

The use of the teaching day was of interest to the writer. Any shop teaching situation requires a certain amount of time for preparation of class materials, ordering, record keeping and maintenance of tools and equipment. It was decided to interrogate the instructors regarding a preparation period during the school day. Question relative to the number of hours per day an instructor spends with the students were asked.

II. STATEMENT OF PROBLEM

It was the purpose of this study of the day trade and industrial instructors in Minnesota to:

---

[2] Ibid.

1. Compile statistical information about trade and industrial instructors in the State of Minnesota in the following areas:

a) Personal information

b) Professional teacher training

c) Type of certification

d) Teaching experience in day schools

e) Trade experience

f) Amount of general education

g) General information

2. Assemble the selected data about these instructors

3. Prepare tables which indicate the relationship between instructional personnel in the various area schools.

III. DEFINITION OF TERMS

In order to comprehend this paper, there are certain terms used which are common to the vocational education field. The definitions which follow were taken from the "Handbook for Supervisors, Trade and Industrial Education."[3]

---

[3]"Handbook for Supervisors, Trade and Industrial Education," (Minnesota State Department of Education, Vocational Division, St. Paul, Minnesota), Pp. 7-30.

Area Vocational-Technical School. A school offering specialized training to students in a large territory, usually involving geographical area larger than a school district.

Related Subjects. Instruction designed to increase knowledge, understanding, and ability to solve technical and theoretical problems concerned with a particular occupation.

Teacher Certification. The approval action taken by legally authorized school authorities on the professional and technical qualifications of teachers based on minimum standards adopted in the state.

Initial Certificates and Renewals. First certificates are issued for two years and subsequent renewals for one year each until all requirements have been satisfied. At this time either a three or five year certificate will be issued. The five year certificates are issued for the Day Trade Program and three year certificates for the Evening Extension Programs.

Temporary Permits. In unusual situations in which a school has experienced an emergency, a temporary permit may be issued to an instructor. The permit expires on July 1 of the year for which it is issued and cannot be renewed.

Trade Experience for Day Trade Certificate. The instructor shall be considered a master workman in his trade and have had at least three years of journeyman experience as a wage earner in the trade in which he is to teach.

He shall have had sufficient technical training or experience so he can teach all the necessary phases of this instruction to the workers.

Professional Preparation and Teacher. A minimum of 192 hours of approved teacher training experience of which at least 96 hours shall be of a college level. No more than 24 hours of the remaining 96 hours shall be of the nature of skill or competency workshops. He shall qualify for a beginning vocational certificate under the policies established by the State Department of Education.

Training for Day Trade Certificate. Present policy for certification of day trade shop teachers is to require 24 clock hours of teacher training prior to the issuance of

the first certificate. Progress in teacher training must then be continued for each one year renewal. This is generally considered to be 24 clock hours or two quarter credits each year. These classes must be of approved vocational courses or teacher training sessions.

Certified industrial arts teachers who can qualify with respect to practical experience should have their credits evaluated as it might be possible to attain vocational certification without the total 192 clock hours.

College Degrees. A day trade shop teacher not having a degree should be encouraged to work toward this goal in vocational education.

Related Trade Teachers. Certification of related subjects trade teachers requires twenty-four clock hours of teacher training prior to the issuance of the first certificate. Progress in teacher training must then be continued for each one year renewal. This is generally considered to be twenty-four clock hours or two quarter credits each year. These classes must be approved vocational courses or teacher training sessions. Practical experience must consist of four thousand hours of recent

employment in the related area. The teacher must also have two thousand hours beyond high school in the area of the technical occupation as added experience or education.

If the person is a certified high school teacher and has twenty-four clock hours of vocational teacher training, he need have a minimum of two thousand hours of employment in related area and four years beyond high school in the field of technical occupation.

IV. EXAMINATION OF UNPUBLISHED MATERIALS

Among the Plan B papers on file at the University of Minnesota, some were found which dealt with investigation of the industrial arts instructors and evening extension school instructors. No paper was found which dealt with the area day school trade and industrial instructors in the vein that the writer planned to use.

Mr. George DeVries made a study of the industrial arts teachers in the State of Minnesota in 1961-62.[4] Part

---

[4] George E. DeVries, "A Survey of Training, Experience, Salaries, Degrees Held, Tenure, Department Staff Size, Subject Areas Taught, Extra-Curricular Assignments and Class Loads with Limited Comparison of Previous Data," (unpublished Plan B Paper, University of Minnesota, Minneapolis, Minnesota, 1962).

of this study was concerned with areas similar to those in the writer's survey. These areas related to teacher training, experience, salaries, tenure, extra curricular assignments and subject areas. The study was used as a form for checking ideas possessed by the writer relative to similar situations in the area day trade schools. DeVries obtained his information from records on file in the Minnesota Department of Education, whereas, this writer gathered his information by a survey questionnaire.

In 1955, Mr. Raymond M. Davoli conducted a survey, using a questionnaire, of the trade and industrial evening school instructors in the State of Minnesota.[5] Information taken from this paper in the areas of trade experience, teaching experience, age, and general education was helpful to the writer in the formulation of questions. Davoli's paper was concerned primarily with the evening school teachers' problem areas rather than a profile or characterization of the instructors.

---

[5]Raymond M. Davoli, "The Trade and Industrial Evening Instructor in Minnesota," (Unpublished Plan B paper, University of Minnesota, Minneapolis, Minnesota, 1955).

V. PLAN OF THE STUDY

The writer decided that a questionnaire would be the best method for gathering the required information. Preliminary investigation helped to decide on a closed-end type of question. This would facilitate tabulation of the results and limit the number of responses to the variou questions. It was decided that content and assistance in formulating the questionnaire could be gained from several individuals, as follows:

1. Howard F. Nelson, Professor and Chairman, Department of Industrial Education, University of Minnesota, Adviser.

2. Harold T. Widdowson, Professor, University of Minnesota.

3. Fred L. Gordon, Supervisor of Trade and Industrial Education, State Department of Education in Minnesota.

4. Robert Van Tries, Assistant State Director, Minnesota Vocational Education.

Several informal meetings were held with the above mentioned persons, and also, with other individuals associated with the vocational education program. The "Minnesota State Plan for Vocational Education" was discussed at these

meetings.[6] Various parts of this plan were considered relative to work experience, type of certificate, salaries, ages of instructors, degree of education and additional trade experience gained since certification. All of those persons involved in the discussions were asked which particular elements of the study they were interested in. These elements and ideas were then formulated into questions.

It was decided to group the questions into several broad categories. The questions were roughly drafted and put into their corresponding groups. These divisions in the questionnaire were as follows:

1. Personal information
2. Professional teacher training and certification
3. Trade experience
4. Teaching experience
5. General information

These broad categories of questions were then discussed with Professor Howard F. Nelson and Harold T. Widdowson, University of Minnesota, and Mr. Robert P. Van Tries and

---

[6] "Minnesota State Plan for Vocational Education," (Minnesota State Department of Education, Vocational Division, St. Paul, Minnesota, Revised 1962).

Mr. Fred L. Gordon, of the Minnesota State Department of Education. The writer, with the help of the above named persons, formulated questions pertinent to each of the divisions in the questionnaire. After a group of questions was formulated they were shown to the other individuals interested in the study. Each question was discussed relative to understanding and interpretation by the respondents. It was the desire of the writer to word the questions in such a manner that they would be similarly interpreted by each respondent. Development of the questionnaire required several revisions and rewording of questions to eliminate as much chance for misunderstanding as possible.

After the final form was decided on, it was duplicated and a trial questionnaire was sent to Mr. Dale Davidson, Coordinator at Minneapolis Vocational School. Mr. Davidson was requested to give the trial questionnaires to various instructors in the Minneapolis Vocational Day School. Davidson made no attempt to choose any certain instructors, but made a random distribution of the trial questionnaires. These instructors were requested to complete the questionnaires, note time required for answering, and indicate by notes on the questionnaire any questions that were not clearly

understood. All of the trial questionnaires were returned and the required revisions were made by the writer. The final form of the questionnaire was duplicated and made ready for distribution. A sample questionnaire has been included in Appendix A, page 81.

In order to increase the percentage of respondents to the questionnaire, it was decided to mail them to the directors of the various area vocational schools. Mr. Van Tries of the Minnesota State Department of Education was contacted, whereupon a cover letter was drafted by him to the various directors. Appendix B, page 85, includes a copy of Mr. Van Tries' letter to the area school directors. This letter contained a request to the directors of the area day trade schools that they assume responsibility for distribution of the questionnaire to their day school instructors, and upon completion, return them to the writer. The writer enclosed a self-addressed, stamped envelope for the return of the questionnaires to the writer. A letter drafted by the writer explaining the purpose of the questionnaire to the area school directors was also enclosed. A copy of this letter appears in Appendix C, page 86.

The writer wished to obtain a return of about ninety percent of the questionnaires. This percentage would provide a high degree of accuracy in profiling the teacher personnel involved in the study. The original respondents totaled less than the desired amount; therefore it was decided to send out follow-up questionnaires to the non-respondents. This was accomplished by cross-checking the names on the returned questionnaires against the list of vocational teachers on file with the State Department of Education, Vocational Division. These people were sent another questionnaire and a cover letter requesting them to complete the questionnaire and return it to the writer in the enclosed addressed and stamped envelope. A copy of this letter has been included in Appendix D, page

These responses plus the original one hundred ninety responses provided a total return of two hundred nine, or 89.7 percent.

VI. LIMITATIONS OF THE STUDY

This survey was conducted in all the public area day trade and technical vocational schools in the State of Minnesota. This does not include part-time trade extension or evening trade extension educational programs.

There were fifteen area schools in operation at the time of the original survey questionnaire mailing on May 5, 1964. These schools were located in the cities of Alexandria, Austin, Duluth, St. Cloud, St. Paul, Staples, Thief River Falls, Wadena, Willmar, and Winona. A map showing the locations of the area vocational schools in Minnesota appears in Figure 1, page 17. According to the Directory, 1963-64 of the Vocational Division, Minnesota Department of Education, there were listed a total of two hundred thirty-three instructors.[7] The term "instructor" does not include personnel such as principals, coordinators, and directors.

It was not the purpose of the study to provide definite standards for the training and certification of the trade and industrial instructor in Minnesota, nor to compare the instructor with minimum teacher training with the instructor having extensive training. Neither was it the intent of the study to make any comparison between the various schools. It was the writer's intent to gather information by means of the questionnaire to provide only

---

[7]"Directory, 1963-64, Minnesota Trade and Industrial Teachers," (Minnesota Department of Education, Vocational Division, St. Paul, Minnesota).

Figure 1. Location of Area Vocational Schools in Minnesota

a statistical profile of the day school trade and industrial teacher in Minnesota.

VII. SCOPE OF THE STUDY

To the fifteen area schools, two hundred thirty-three questionnaire were mailed. Of this total two hundred nine questionnaires were partially or fully completed and returned by the respondents. This gave a total average return on the survey of 89.7 percent. The high percentage of return indicated a great degree of cooperation and interest on the part of the area school directors and their instructors.

Analysis of the survey with reference to the questionnaires distributed and those returned may be made from Table 1, page 19. It was interesting to note that eight of the fifteen area schools studied had a 100 percent return of the questionnaires. The lowest percentage of return was 77.4 percent.

The total of two hundred nine returns shown in the table included a total of six returns, or 2.87 percent, which could not be tabulated. These people did not complete the questionnaires for the following reasons: one was

TABLE I

TOTAL PERCENTAGE RETURN			89.7

deceased; one had quit to teach industrial arts full time; two had left teaching; one only taught one specialized area of twenty-four hours per year; one taught one specialized area of forty hours per year. This would give a total of two hundred three returns that were tabulated or 87.1 per cent.

For purposes of analysis, a series of tabulation sheets were formulated. A copy of the tabulation sheet has been included in Appendix E, page 88. These sheets provided the basic statistics for the following discussion of the day school trade and industrial instructors in Minnesota.

In the subsequent chapters of this paper, the writer reviews the training, certification, trade and teaching experience, and personal and general information regarding the day school trade and industrial instructors in Minnesota, thereby providing a statistical profile of these persons.

CHAPTER II

SURVEY RESULTS AND ANNOTATIONS

I. GENERAL INFORMATION ON THE VOCATIONAL DAY SCHOOL INSTRUCTORS

Part of the questionnaire was designed to gather general information regarding the day school trade and industrial instructor. This information was concerned with: (1) sex and age of the respondents, (2) amount of general education, (3) salary, (4) how the past summer was spent (1963).

Table II, page 22, shows a summary of the ages of the respondents in intervals of five years. The table shows a range of twenty one to seventy years in the ages of the instructors. The median age of the instructors was forty-three years which would seem to indicate that the requirements in trade competence for certification tend to raise the age of the average trade and industrial instructor.

The writer would like to point out that the youngest instructor was twenty-three years old. There were only fifteen of the respondents in the age group of thirty years or under, representing 8.8 per cent of the total respondents.

TABLE II

TOTALS	1	14	22	30	33	26	18	13	9	4	33
MEDIAN	43.3 years										

The tabulations in Table II indicated the instructor in a trade and industrial school was more likely to be an older, more mature type of person. Thirteen of the respondents were in the over sixty years of age group; this constituted 7.6 per cent of the total number of respondents. Of the total group of respondents, thirty-three or 16.2 per cent

failed to indicate their age on the questionnaire. It should be noted that twenty-six or 78.8 per cent of those that did not answer this question were from the largest area school.

The survey indicated that of the total of two hundred three respondents, one hundred fifty-seven were male and forty-six were female.

Salaries of the instructors are shown in Table III, page 24, for the various area schools. These were broken into groups having an interval of one thousand dollars. The question asked the respondent to indicate his annual contract salary for the year 1963-64. It also instructed the respondent to <u>not</u> include any other income than for day trade school. Of the two hundred three respondents, five neglected to indicate their salaries.

There were six responses in the under four thousand dollar group and two of these stated on the questionnaire that the contract was for part or one-half time teaching. Two persons indicated a salary of between four thousand, one dollars and five thousand dollars. This meant that of the one hundred ninety eight respondents only eight received salaries of less than five thousand dollars per school year;

this was 4.4 per cent of the total. None of the instructors indicated that he had a contract for salary over ten thousand dollars for the school year.

The survey indicated the median salary of the one hundred ninety-eight respondents to be seven thousand, two hundred sixty-nine dollars. It was noteworthy that eighty-nine or 47.5 per cent received a salary of between six thousand, one dollars and eight thousand dollars per year.

Table IV, page 26, gives a summary picture of the amount of secondary education completed by the respondents.

The question of how much general education was necessary for a tradesman to be qualified as a day school instructor was a controversial one. The "Minnesota State Plan for Vocational Education"[1] stressed the need for additional education and trade training for the certified personnel.

Of the two hundred three respondents, four failed to answer the question relative to a high school education. One hundred eighty-eight or 92.6 per cent of those responding

had completed high school. Eleven indicated they had not completed a high school program, and of those, three did not show the number of years completed.

The "Minnesota State Plan for Vocational Education"[2] stressed the desire for the instructors to do advanced work in education and also to work toward a four year college degree. Prosser and Bass have stated that a tradesman-instructor should be educated in "the sense that the trade would use the term; not necessarily well educated from the academic standpoint."[3] Most writers on the subject of vocational teacher qualifications agree that the more general education possessed by an instructor who was also a master of the trade, the better qualified he would be as a teacher.

An attempt was made in the study to ascertain the number of instructors who held a college degree. No attempt was made to determine the field in which the degree was granted. A summary of the findings for the day school instructors appears in Table V, page 28.

---

[2] Ibid., Section VII, 7.1.

Wadena	6	0	
Willmar	6	6	
Winona	4	1	1
TOTALS	123	60	14

Note: Of the 203 questionnaires returned 6 did not answer this question.

The survey disclosed that seventy-four or 37.6 per cent of the one hundred ninety-seven instructors who responded to the question had obtained four year college degrees or more. Minneapolis, the largest of the schools with fifty-two questionnaires returned, had twenty-nine or 55.8 per cent of the instructors possessing college degrees. The reader will

note that more than 50 per cent of the instructors at Winona, Willmar, St. Cloud and Hibbing have college degrees. It was of interest to observe that all of the above mentioned schools have relatively easy access to various state colleges and the University of Minnesota.

The survey also revealed that fourteen of the one hundred ninety-seven respondents held a Master's degree or the equivalent.

How teachers spend their summers was of interest to the writer and others concerned with vocational education. The general public seems to have the idea that teachers work only part of the year in their teaching positions and spend the summer in one long vacation. The writer set up the hypothesis that the average instructor would spend most of his non-teaching time in preparation for the next year or working in the trades to improve his instructional and trade competence. According to Keller, "The teacher of an occupation must know that trade and he must at all times keep up with new knowledge and new techniques."[4]

---

[4]Franklin Keller, Principles of Vocational Education (Boston: Heath and Co., 1948), Pp. 330.

Mays also indicated in his book on vocational education the desirability of the vocational teacher to renew contact with actual working conditions and to renew his skills in the area in which he is teaching.[5]

Question number twenty-three of the survey was an attempt to find out how the average summer vacation was spent. Table VI, page 31, shows a summary of the findings. It was noted that five of the seven choices were concerned with improvement in teaching techniques (additional schooling), time spent in the school shop, or working in the trade in which they were certified. The total responses were more than the number of respondents because many of them indicated their summers were spent doing a combination of activities.

Tabulations showed that sixty-one or 30 per cent of the respondents worked in the trade in which they held a teaching certificate during the summer. Seventy-three or 36 per cent spent part or all of their summer teaching. It should be noted that only sixteen of the respondents used

the summer to gain additional schooling. This was only 8 per cent of the total number of respondents. Sixteen per cent spent some of their summer vacation time on preparation of class material.

II. TRADE EXPERIENCE OF VOCATIONAL DAY SCHOOL INSTRUCTORS

The questions in Group III of the questionnaire were related to trade experience of the various instructors. The "Minnesota State Plan for Vocational Education" sets forth the minimum standards which must be met for the certification of teachers. The requirements for trade shop instructors were: four years as a learner, and three years as a journeyman, or a total of seven years of practical experience. The requirements for related trade teachers to qualify for vocational certification specified four thousand hours of practical experience in the related area or two thousand hours of practical experience plus a high school teaching certificate and twenty-four hours of vocational teacher training. In special circumstances the requirements for

certification may be waived for a temporary permit but the practical experience requirements may not.[6]

Table VII, page 34, shows the summation of the type of training each teacher received as related to an apprenticeship program. The question was also asked whether an apprenticeship was served in a registered or non-registered program. The table showed ninety-seven or 47.8 per cent of the respondents took part in some type of an apprenticeship program, but only twenty-six of these ninety-seven were in a registered apprenticeship program. An almost equal number, ninety-six, did not complete an apprenticeship program of any type. The latter would indicate either a self-taught tradesman or someone learning the trade by working with others and picking up the skill as he progressed. Ten of the respondents failed to answer the question.

The number of years of trade experience possessed by the various teachers has been indicated in Table VIII. Only one of the respondents failed to answer this question. There

instructors who teach related information only and therefor might not have practical trade experience in the field since this was not a requirement.

The returns also included people in the fields of commercial art, cosmetology, medical laboratory assistant, practical nursing and occupational therapy. It was possible that some of the instructors in these areas went directly into teaching in a vocational school after receiving a degree in higher education. The median number of years experience for all respondents was 12.45 years.

Table IX, page 37, shows the amount of experience gained since the respondents began teaching in the day trade program. This gave some indication of how well the instructors were keeping up with the current trade practices and new techniques being introduced into the trades.

Of the two hundred three respondents, on hundred twenty-three have gained two years or less of additional trade experience after starting to teach. This number, approximately sixty per cent, seemed quite high but there were several factors which limited the amount of time available for additional work in the trades. Many of the instructors were on a twelve month contract, others were encouraged to attend school during the summer, still others taught a summer course. Taking these factors into consideration, one can understand that time was a limiting factor in gaining additional trade experience.

One of the ways in which a trade instructor could keep abreast of working conditions in the field would be to belong to various organizations in the trade area. This could be accomplished through labor organizations or employers' associations. The teacher could also become familiar with new trends in the area, such as materials, procedures,

and technical developments. Part of the questionnaire was an attempt to find out how many of the instructors belonged to these various organizations.

Table X, page 39, gives a summary of questions fifteen and sixteen on the survey questionnaire. Of the two hundred three tabulated responses eighty-four or 41.4 per cent indicated they were card holders or had membership in a labor organization. Only five of the respondents did not answer the question. The number of respondents who belonged to a contractors' or employers' association was much smaller. Twenty-two or 10.8 per cent were members of this type of organization. Seven failed to indicate an answer on the questionnaire.

III. VOCATIONAL CERTIFICATION AND TEACHER TRAINING

The four types of certification for trade and industrial instructors as authorized in the "Minnesota State Plan for Vocational Education" were listed as answers to question five on the questionnaire.[7] These were the one year renewal,

---

first two year, three year and five year certificates. Two teachers indicated they held a one year temporary permit which could be issued in unusual situations in which a school had experienced an emergency. This temporary permit could not be reissued and expired on July first of the year in which it was issued. The first certificate issued was for two years, and the subsequent certificates were for one year

each until requirements for the five year certification were met. The three year certificate was one issued for evening trade extension teachers.

Table XI, page 41, provides a breakdown of the types of certificates held by the respondents. One hundred ten of the respondents, or 54.2 per cent, possessed a five year certificate. The number of holders of one year renewal and two year certificates were the same. Each had a total of thirty-eight or 18.7 per cent. This would correlate closely with question number three on the questionnaire. This question related to the number of years of teaching experience and showed that seventy-one of the respondents had three years or less of teaching experience at the time of the survey.

Only two of the respondents indicated that they held a one year provisional certificate. This wald be slightly less than one per cent of the respondents.

Eight of the respondents indicated they held a three year certificate. This certificate was issued for evening trade extension teachers. The requirements for this certificate are the same as for a two year certificate for a day trade shop teacher. It may be possible that a few instructors in the evening extension trade program are moving into

+ - Life certificate - Two respondents indicated they held a life certificate as a day trade instructor but the "Minnesota State Plan for Vocational Education" does not mention this type of certification in their latest publication.

the day trade school program. These eight respondents would be approximately four per cent of the total respondents.

Five, or approximately two and one half per cent, of the respondents failed to answer this question.

Life certificate was written in on the questionnaire as an answer by two of the respondents. The writer did not include this answer in the choices of responses because the "Minnesota State Plan for Vocational Education" does not make a provision for this type of certificate.

Question number eight of the questionnaire asked if the respondent was certified in more than one area. The writer thought this might be possible because of close relationship between some of the trades. Table XII, page 43, gives a tabulation of this question. It shows one hundred sixty-one instructors, or 79.3 per cent, were holding one certificate. The balance of forty-two were certified in more than one area, and were asked to indicate their areas of certification. Twenty-eight of the forty two did so; these areas are listed following Table XII.

Those people who indicated they were certified in more than one area were asked to state their combination of trade areas. The combinations were wide and varied, but there seemed to be a close association between the areas. In only one instance was the same combination listed twice; this was in related science, mathmatics and drawing. The balance of the list were all singular responses. These teaching combinations are listed following Table XII.

There were various types of training programs available for the trade teachers. These programs varied from the college type courses to the industrial workshops which were sponsored by various manufacturers. Table XIII gives a visual picture of the use of these teacher-training programs. The totals in the table did not correspond to the number of tabulated (203) returns. The respondents were requested to check the various types of training programs in which they had participated. Some of the instructors used only one of these training programs and others used all four of them.

The most used type of training program was the "on campus for college credit" program. One hundred forty-one, or 69.5 per cent, of the respondents used this type of training program. The least used program was the "off campus for college credit" program which 24.6 per cent of the respondents

Note: Three respondents failed to answer this question, one each from Austin, Staples and Winona.

used. Industrial workshops were used by 44.3 per cent of the teachers, and the "off campus for clock hours" programs were used by 49.2 per cent.

The "Minnesota State Plan for Vocational Education" requires the teachers to meet certain minimum standards for teacher certification as previously discussed in the paper. Issuance of the first certificate was contingent upon having twenty-four clock hours or two quarter credits of approved teacher training before beginning to teach. Progress toward full certification must have been continued for issuance of the one year renewal certificate. Question number ten on the survey questionnaire was an attempt to learn how much teacher training the various instructors had received prior to their first teaching assignment.

The tabulations in Table XIV, page 47, show 39.4 per cent of the present teachers as having no credits toward certification when beginning to teach in the day trade program. This indicated that these teachers started in the program with a temporary certificate. Sixty-four or 32.5 per cent had at least sixteen quarter credits when starting their first teaching assignment. Of the two hundred three tabulated returns, twenty-nine did not answer the question. Some of the instructors have been in the program for a long time and therefore probably did not remember just when they took their teacher preparation courses.

TOTALS	80	6	4	8	2	4	3	1	2	5	59	29

Note: One quarter credit equals twelve clock hours.

In conjunction with the question on number of credits for certification before teaching, an attempt was made to determine how many credits the instructor had acquired beyond the required sixteen quarter credits (192 clock hours). The State Department of Education, Vocational Division, encouraged the continuance of course work and working toward a four

year degree. Table XV, page 49, showed a tabulation of the replies regarding the number of credits beyond the required minimum. Two of the two hundred three respondents had no credits beyond the required minimum. Fifty-seven or 28 per cent had more than thirty credits beyond the required number of credits for certification. The number of respondents indicating from two to thirty credits totaled ninety-five or 46.8 per cent. The persons who failed to answer the question totaled forty-nine or 24.1 per cent of the respondents.

The tabulations in Table XV would indicate that the majority of the instructors in day trade and industrial schools have continued their education after receiving their vocational teaching certificates.

Question number eleven in the questionnaire was tabulated in Table XVI, page 50. Thirty-one instructors indicated they were currently enrolled in teacher training courses, and ninety instructors indicated they had taken a course, or course, within the past year. Combining the two gave us a total of one hundred twenty-one or 59.6 per cent of the teachers having taken courses very recently. The non-respondents on this question totaled eleven or 5.4 per cent.

The figures on Table XVI show that the majority of instructors are interested in their professional growth. The writer noted that one hundred fifty-eight or 77.8 per cent of the instructors had taken some training within the last three year period.

IV. MOBILITY AND TENURE OF INSTRUCTORS

The following portion of this paper deals with teaching experience, mobility of teachers, and the teaching situation. An attempt was made to determine: (1) how many schools the respondent had taught in, (2) how long he had been in his present teaching position, (3) total number of years of day trade teaching experience.

Table XVII, page 52, gives the tabulations for the number of different schools in which the respondents had taught. The writer found that one hundred twenty or 59.1 per cent of the respondents had taught in one school, forty-seven or 23.1 per cent had taught in two schools, and twenty-one or 10.6 per cent had taught in three schools. These figures indicated that the teachers have a tendency to remain in their first teaching assignment. The mobility of the instructors is relatively low. Out of the total of two hundred three tabulated responses one person from Minneapolis had taught in seven different schools; one respondent from St. Paul had taught in eight different schools. Three respondents failed to answer this question; this was 1.5 per cent of the tabulated responses.

Median - 4.5 years

their present teaching position. The writer found that one hundred six of the respondents had been teaching for five years or less. This figure is 52.2 per cent of the tabulated responses. Ten of the respondents had been in their present position twenty to twenty-four years, and nine had been in their present position twenty-five years or more. The low median point of 4.5 year was probably influenced by the recent expansion of the trade and industrial program in existing schools, and also, the opening of new facilities in the past few years. Only one person of the two hundred three respondents failed to answer this question.

Question number three of the questionnaire requested the respondents to indicate the total number of year they had been teaching in the day trade program. Only three persons of the total returned questionnaires failed to answer the question. The writer found that one hundred ten of the respondents had been teaching for five years or less. The median point for length of time spent in teaching was 5.17 years. Twelve of the respondents had been in the day trade program from twenty to twenty-five years. Only four of the respondents had been teaching for twenty-five years or more. One respondent from St. Paul indicated by a note that he had

been teaching in the day trade program for thirty-seven years. In Table XIX, Total Number of Years Teaching, as in Table XVIII, Number of Years Teaching in Present Position, the median point of 5.17 years seems to be quite low. This low median point would be influenced again by the recent expansion of the trade and industrial program and the opening of new schools and facilities.

TABLE XIX

Median - 5.17 years

Three respondents failed to answer the question.

V. VOCATIONAL PROGRAMS AND TEACHING COMBINATIONS

Question number seventeen on the survey questionnaire was an attempt to find out in which vocational program or types of programs the individual instructor was teaching. Basically, the vocational program concerns itself with the full time day trade school or the evening extension program. The lattter program for people learning a trade and conducted in the late afternoon and evening hours. Some of the vocational schools are operated in separate facilities while others use the industrial arts facilities in the public high schools.

A certified industrial arts instructor may qualify for a vocational certificate, but the holder of a vocational certificate cannot teach in the public school industrial arts program without a secondary school teaching certificate.

The writer thought it possible for a person to teach in almost any combination of situations. Therefore, question seventeen was stated in such a way as to give the respondent a possibility to indicate these combinations. The combinations are shown along with the tabulations in Table XX.

TABLE XX

TEACHING COMBINATIONS

Area Vocational School	Day Trade Only	Day Trade and Evening Extension	Day Trade & Jr. H. Arts	Day Trade & Sr. H. Ind. Arts	Other

Wadena	5	1			
Willmar	6	6			
Winona	1	3		1	1
TOTALS	96	82	0	14	8

\+ - One person taught at University of Minnesota, Duluth Branch, part time.

++ - One person taught in a day trade vocational school in the mornings and a post high school course in the late afternoon.

Note: Three individuals from Minneapolis failed to answer this question.

The tabulations in Table XX indicated ninety-six instructors were in the day trade program only. This would be 47.3 per cent of the respondents. Eighty-two or 40.4 per cent taught in the day trade program and also the evening extension vocational program. None of the respondents indicated they taught in the junior high school industrial arts and the day trade program, although fourteen individuals taught a combination of day trade and senior high school industrial arts. Eight respondents indicated they were in some other teaching combinations but did not indicate what these were.

Table XXI shows the tabulations for question number eighteen which was designed to determine the teaching combinations relative to shop work and the related classroom information. The "Minnesota Plan for Vocational Education" provides vocational certification for a person to teach related information only.[8] This type of certificate would not allow that individual to teach in the shop. He would be concerned primarily with instruction designed to increase

---

[8]"Minnesota State Plan for Vocational Education," op. cit., Section V, 2.13-2B.

knowledge, understanding, and ability to solve technical and theoretical problems regarding a particular occupation.

TABLE XXI

SHOP AND RELATED INFORMATION TEACHING COMBINATIONS

Willmar		10		2
Winona		6		
TOTALS	10	150	11	28

Note: Four persons failed to answer this question, two from Minneapolis, one each from Austin and Staples.

The tabulations show that most of the vocational instructors taught both shop and the related information. One hundred fifty, 73.9 per cent, of the instructors taught this combination. Much of this related information was so closely interwoven with the actual shop work that it would have been very difficult to separate the two. Another indication of this tie-in would be the small number of instructors that teach only shop. Of the two hundred three tabulated responses only ten indicated they taught shop alone. Eleven of the respondents, 4.9 per cent, taught in the related, classroom only, situation. Twenty-eight, or 13.3 per cent, taught shop and only part of the related information.

Question number twenty was an attempt to find out how many hours per day the instructor spent with his students. Specifically, the question asked, "How many actual teaching hours per day do you have with the students?" The tabulations are shown in Table XXII. The greatest frequency was in the column for six hours per day. One hundred ten, 54.2 per cent, indicated that they spent this number of hours with the students. The frequencies for a five hour day and seven hour day with the students were almost equal. Thirty-two

respondents, 15.8 per cent, indicated a five hour teaching day; twenty-eight, 13.3 per cent, spent six hours per day with the students.

TOTALS	1	0	6	32	110	28	17	2	4

+ - One respondent for each school did not answer this question, instead noted that they were part time teachers.

One person indicated he spent one hour per day with the students, and six instructors spent four hours per day with the students. These seven respondents are probably on a part time basis. Referring back to Table III, page 24, regarding annual salaries, five instructors indicated a salary of five thousand dollars or less per year. Three of these stated on the questionnaire that they were part time instructors. In Table XX, page 57, of this paper, a number of the respondents indicated they taught part time in the vocational day school. Fourteen of the respondents indicated they taught in the day trade school and also senior high school industrial arts. Three others indicated they were teaching only part time in the day trade school.

Seventeen instructors spent eight hours per day with the students. It was possible that these people also taught in the evening extension program and figured these hours as part of the teaching day spent with the students. Four respondents failed to answer the question; two wrote a note on the questionnaire stating they were part time instructors.

Table XXIII shows the summations for question twenty-four on the questionnaires. This question was concerned with the length of the instructors' teaching contracts. The

choices for response were one month intervals from six through twelve months. None of the instructors polled indicated less than a nine month contract, therefore intervals for six, seven, and eight months were omitted from the table.

TOTALS	86	63	10	40	4

Eighty-six or 42.4 per cent of the respondents were on a nine month contract; sixty-three or 31 per cent were on a ten month contract. A larger than expected number were on a twelve month contact. Forty of the respondents, 19.7 per cent, indicated the latter length contract. Referring to Table VI, Summer Schedules for 1963, on page 31, seventy-three of the respondents indicated that they were in a teaching position during the summer. This number of responses made the tabulations of forty instructors on a twelve month contract look more realistic. Ten respondents, 4.9 per cent, indicated they were on an eleven month contract.

It may be of interest to some to note that all of the instructors at the Staples school were on a twelve month contract. Grand Rapids instructors were on either an eleven or twelve month contract. The two largest schools, Minneapolis and St. Paul, had practically all instructors on nine or ten month contracts.

VI. PREPARATION TIME AND EXTRA ASSIGNMENTS

The quality of teaching in any situation would be influenced by factors which are beyond the control of the instructors. These could be assignments made by administrators

and directors of the particular school in which the teacher was assigned. One of these factors could be the availability of time during the school day for the preparation of class and shop materials. Another factor could be non-teaching duties such as, lunch room supervision, study hall and hall duty. These assignments take available preparation time away from the instructor. There were some preparations which could be done after school hours or at home, but various things must be done in the shop or class room.

Question nineteen asked if the instructor had a preparation period during the school day. One hundred twenty-nine, or 63.5 per cent, indicated they did not have a preparation period. Seventy-one, 35 per cent, do have a preparation period during the school day. Three people failed to answer the question.

Thirty-seven, 18.2 per cent, of the respondents had extra duties assigned such as lunch room supervision, hall duty or study hall. One hundred sixty-four, 80.3 per cent, do not have extra sssignments to interfere with their teaching responsibilities. Question twenty-one was not answered by two respondents.

CHAPTER III

SUMMARY AND CONCLUSIONS

I. SUMMARY

The writer felt that the questionnaire survey of area vocational trade and industrial instructors in Minnesota produced certain pertinent information of value to the interested parties. There were two hundred nine questionnaires returned to the writer from the total personnel in the area vocational day schools in Minnesota; two hundred three of these were tabulated. Six returns were not tabulated because the respondents had left the teaching profession or were specialists who taught a very short specialized subject. One hundred fifty-seven of the respondents were male, and forty-six were female. The median age of the respondents was 43.3 years.

The sections of the questionnaire concerned with the educational background of the instructors revealed eleven did not complete high school. Sixty of the respondents had a bachelor's degree and fourteen were holders of a master's degree or the equivalent. The survey showed the majority of the teachers continued their education after certification,

one hundred fifty-eight having taken additional courses in the past three years. Seventy-five per cent of the respondents have had additional teacher training courses and have had more than the necessary credits for certification.

Questions on the use of various teacher training programs available revealed that the "one campus courses for college credit" were the most used. One hundred forty-one instructors had used this type of program. Ninety respondents participated in industrial workshops. About 25 per cent or fifty respondents indicated they had taken "off campus courses for college credit."

The questionnaire tabulations indicated very few of the instructors had participated in a registered apprenticeship training program. Ninety-seven respondents had been in some type of apprenticeship program, but only twenty-six of these received their trade training in a registered apprenticeship program. Ninety-six respondents learned their trade without benefit of any apprenticeship training.

Eighty-four of the respondents disclosed they were members of a labor organization, and twenty-two were members of an employers' or contractors' association.

The median length of time spent in the trade before starting to teach in the day trade program was 12.45 years. Eight respondents had less than two years of trade experience, and another twenty-seven indicated they had from three to five years of experience. Thirty-two respondents had from six to eight years of work experience before starting to teach.

The amount of time spent working in the certified trade after beginning to teach was quite low. Thirty-three respondents had gained no additional experience, sixty-nine had gained one additional year, and twenty-one had acquired two more years of work experience. These figures represent approximately sixty per cent of the tabulated questionnaire.

Tabulations of the types of vocational certificates held by the respondents showed one hundred ten, or 54.2 per cent, having the five year certificate. Seventy-six held either a two year certificate or a one year renewal certificate. The latter certificates are issued until the teacher has completed the requirements for a five year certificate.

It was found in the return of the questionnaires that one hundred sixty-one instructors were certified in one area of teaching. The remaining instructors, forty-two, were

certified in more than one area. The responses indicated that where an instructor held a teaching certificate in more than one area, these were generally in very closely related trades.

The results of the questionnaire indicated the following factors regarding the surveyed instructors, ninety-six taught in the day trade program only, and eighty-two taught in the day trade and also the evening extension programs. A person holding a vocational certificate for the day trade school may use that certificate for teaching in the evening extension program. The majority, one hundred fifty respondents, taught both the shop phase of instruction and also the related information. Eleven instructors taught related subjects only and spent no time teaching in the shop. Fourteen instructors taught in the vocational program and also in a senior high school industrial arts program.

Mobility of the instructors was quite low; fifty-nine per cent taught in only one school, twenty-three per cent taught in two schools, and the balance of eighteen per cent taught in more than two schools. The median length of time teaching in their present school was 4.5 years, while the median for total years of teaching experience was 5.2

years. These figures would seem to indicate that most instructors who change teaching locations make this change during the first few years after beginning to teach.

The survey revealed that the majority of instructors spent a total of six hours per day with the students. Only 18.2 per cent of the instructors were given extra assignments such as hall duty, lunchroom or study hall supervision.

Of the group surveyed, 63.5 per cent indicated they did not have a special, free preparation period during the school day. The writer would assume these instructors must make their shop and class preparations on their own time.

The median salary of the respondents was $7,269 per school year. The length of the contract varied from nine to twelve months. Eighty-six instructors had a nine month contract, sixty-three had a ten month contract, and ten had an eleven month contract. Forty instructors were on a twelve month contract.

The survey indicated the instructors spent the summer months in a variety of pursuits. Sixty-one persons worked in the trade in which they were certified. Seventy-three spent the summer teaching, and thirty-three used the summer months for preparation of class material. Vacation and

travel was enjoyed by forty of the respondents. Although the vocational instructor was encouraged to improve his professional growth by additional schooling and to work toward a college degree, only sixteen of the respondents attended school during the summer of 1963.

A relatively small proportion of the instructors learned their trade in a registered apprenticeship program; the majority of them learned their trade through work experience.

Based on the tabulated survey the following thumb nail sketch of an average day trade and industrial instructor in the Minnesota area vocational schools was formulated. The typical instructor was forty-three years of age, had been in his present teaching position for four and one-half years, and had an annual contract of $7,269. He taught six hours per day for an average of ten months per year.

The average instructor had twelve and one-half years of trade experience before starting to teach. He had a minimum of a high school diploma and held a five year vocational teaching certificate. The typical instructor received his teacher training by taking courses on campus for college credits and was continuing his education for professional

advancement. The average instructor did not belong to a labor organization.

II. CONCLUSIONS

From a study of the information found in the survey, the writer drew certain conclusions which are discussed in the following paragraphs.

Although the Minnesota State Department of Education, Vocational Division, has stressed the importance of trade competency before certification, many of the instructors certified do not seem to meet this requirement. Very few of the instructors have participated in a registered apprenticeship program which would give them a systematic learning experience. The Minnesota State Department of Education requires a total of seven years trade experience. Approximately one-fourth of the instructors had less than this amount.

Another area of certification that appeared weak concerned the requirement that the instructor have a minimum of twenty-four clock hours (2 credits) of teacher training instruction before issuance of the first certificate. Almost forty per cent of the respondents indicated they had no

teacher training before beginning in the vocational trade program. The other extreme was the approximately thirty per cent which had all their credits toward certification before starting to teach. There seemed to be some confusion on the part of the respondents with regard to certification credits. The writer anticipated this problem; therefore a note was made on each pertinent question in the questionnaire that twelve clock hours was the equivalent of one quarter credit. Even though this was done, twenty-nine respondents failed to answer question number nine, and forty-nine did not answer question number ten. Both of these questions pertained to credits for certification.

The surveyed instructors indicated they had participated in most of the various teacher training programs available. The least used was the "off campus for college credit" program. This was used by approximately twenty-five per cent of those surveyed.

The general education achievement of the respondents was higher than the writer had anticipated. Almost all of the respondents had a minimum of a high school education. A four year college degree or more was held by 37 per cent of the respondents. This may have been the result of the

general higher educational achievement level of people, and also, the desire of the individual instructors to raise their educational level. This could be partially substantiated by the fact that over 80 per cent of the respondents had taken additional schooling in the past five years.

The above educational achievement would be an indication of the individuals desire to improve himself. This would seem to be a healthy attitude toward the upgrading of the program.

Opportunity for gaining additional trade competence by working in the trade seemed to be quite limited. Approximately 60 per cent of the teachers gained two years or less of trade experience after beginning to teach. The amount of time available to gain more experience was limited by several factors, such as; attending summer school, teaching in a summer program, the need to supplement regular salary by other work, and part time work in the certified trade was not available.

The majority of the instructors taught both shop and related information. The writer would assume this to be a logical method. The instructor could correlate the students' work in the shop to their work in the classroom, and thus correct problem areas very quickly.

The writer felt that some parts of the questionnaire did not give a true picture of the surveyed instructors. A portion of this was possibly due to the fact that some of the instructors were not totally familiar with terms used by the writer and also generally used by the personnel in the Vocational Division of the Minnesota State Department of Education.

There seemed to be a large amount of confusion on the part of the respondents with regard to certification. The State requirements are given in terms of clock hours of instruction, but many of the teacher training courses are listed as quarter credits. Unless the instructor was familiar with the relationship between clock hours and quarter credits it would be difficult to convert one to the other.

The validity of the responses to the question regarding the number of schools the respondent had taught in could also be questioned. This would be especially true in the responses from the metropolitan area schools. In this case the respondent could have served in several schools but still remained in the same district.

In a follow-up study any questions regarding yearly contracts should be correlated to the length of the contract. The salaries of the various instructors varied greatly. Some of this variance could be caused by the length of the teaching contracts which were from nine to twelve months. Another factor that would influence the salary would be the number of hours spent per day with the students. The tabulations in this study show the time as varying from four to nine hours per day. Another study of this type should be designed to give a relationship between these three factors: (1) hours per day with the students, (2) number of months of contract, (3) amount of contract.

The master list of instructors from which the writer worked was furnished by the Minnesota Department of Education, Vocational Division. This list included names of all certified vocational instructors in the area day trade schools. The list did not differenciate part time and full time teachers. Consequently, when the writer mailed out questionnaires they went to all instructors. Some of the questionnaires which were returned stated the respondent was a part time

instructor, and therefore did not answer the questionnaire. There was no way for the writer to know how many of the non-respondents were part time instructors.

SURVEY QUESTIONNAIRE PUBLIC VOCATIONAL T & I AND TECHNICAL DAY SCHOOL INSTRUCTORS IN MINNESOTA

SURVEY QUESTIONNAIRE
PUBLIC VOCATIONAL T & I AND TECHNICAL
DAY SCHOOL INSTRUCTORS IN MINNESOTA

NAME_____ SEX___ AGE_____

SCHOOL_____

GENERAL DIRECTIONS: Please check or circle the appropriate answer as indicated. Please answer each question as accurately as possible.

GROUP I Personal Information

1. In how many different schools have you held teaching positions?
   Circle one: 1 2 3 4 5 6 7 8 9 10

2. How many years have you been in your present teaching position?
   Circle one: 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15
   16 17 18 19 20 21 22 23 24 25 or more

3. How many years of day trade school teaching experience do you have: (Include 1963-64) _____

4. What is your annual contract salary for the year 1963-64?
   (This does not include any income other than day trade school.)
   Check one:
   ( ) less than $4,000
   ( ) $4,001-$5,000
   ( ) $5,001-$6,000
   ( ) $6,001-$7,000
   ( ) $7,001-$8,000
   ( ) $8,001-$9,000
   ( ) $9,001-$10,000
   ( ) over $10,000

GROUP II Professional Teacher Training and Certification

5. Under which vocational certification are you now teaching?
   Check one:
   ( ) First 2 years certificate
   ( ) 1 year renewal certificate
   ( ) 3 year certificate
   ( ) 5 year certificate

6. Do you have a college degree?
   Check one: ( ) no ( ) B. S. or B. A. ( ) M. A. or equivalent

7. How did you obtain your credits or clock hours for certification?
   Check one or more:
   ( ) On campus course for college credits
   ( ) Off campus courses for college credits
   ( ) Off campus courses for clock hours
   ( ) Industrial work shops (Clinics or institutes)

8. Are you certified for teaching more than one area in a day trade school?
   Check one: ( ) yes ( ) no If yes, indicate which areas:

_____

9. How many credits or equivalent do you have beyond the required minimum? (12 clock hours = 1 quarter credit)
Check one: ( ) 2-6 ( ) 14-18 ( ) 26-30
( ) 8-12 ( ) 20-24 ( ) More than 30 credits

10. How many college credits did you have toward certification when you strated teaching in the day trade program?
(12 clock hours = 1 quarter credit)
Circle one: 0 2 4 6 8 10 12 14 16 18 20 24
Over 24 credits

11. How long has it been since you have taken any additional teacher training courses for credit?
Circle one: 1 2 3 4 5 6 7 8 9 10 or more years

GROUP III Trade Experience

12. Did you complete an apprenticeship program?
Check one: ( ) yes ( ) no ( ) registered ( ) non-registered

13. How many years of trade experience have you had in the area in which you teach?
Circle nearest number of years: 1 2 3 4 5 6 7 8 9 10
11 12 13 14 15 16 17 18 19 20 more than 20 years

14. How much additional trade experience have you had in your area since you started teaching?
Circle nearest number of years: 1 2 3 4 5 More than 5 years

15. Do you hold a card (membership) in a labor organization?
Check one: ( ) yes ( ) no

16. Do you hold membership in a contractors or employers association?
Check one: ( ) yes ( ) no

GROUP IV Teaching Experience

17. What is your teaching combination?
Check one: ( ) Day trade only
( ) Day trade and evening extension classes
( ) Day trade and Junior High Industrial Arts
( ) Day trade and Senior High Industrial Arts
( ) Other

18. Indicate your teaching combination
Check one: ( ) Shop only (no classroom)
( ) Shop and related information
( ) Related information (classroom only)
( ) Shop and part of related information

19. Do you have a preparation period during the regular school day?
Check one: ( ) yes ( ) no

20. How many actual teaching hours do you have per day with the students?
Circle one: 2 3 4 5 6 7 8

84

21. Do you have any non-teaching duties assigned, such as lunch room, study hall, hall duty?
Check one: ( ) yes ( ) no

GROUP V General Information

22. Are you a high school graduate?
Check one: ( ) yes ( ) no
If no, circle grade completed: below 8 8 9 10 11 12

23. What was your summer schedule for the year 1963?
Check one:
( ) Full time school to get additional teacher training
( ) Work in trade in which certified
( ) Maintenance in shop
( ) Vacation, travel, etc.
( ) Other summer employment
( ) Preparation of class materials, course construction, etc.
( ) Teaching

24. How many months per year does your teaching contract cover?
Circle one: 6 7 8 9 10 11 12

Thank you for completing this questionnaire.
Please return to your school director.

APPENDIX B

May 5, 1965

Mr. Vernon R. Maack, Director
Vocational Education
Area Vocational-Technical School
Alexandria, Minnesota 56308

Dear Mr. Maack:

Mr. Howard Ernst is engaged in making a survey of the trade and industrial and technical day school instructors in the public vocational schools of the State of Minnesota. We are interested because it will give us a profile of the instructors as related to their training and certification, trade experience, and teaching experience.

Mr. Ernst will very shortly write to you and enclose sufficient forms for your day school trade and industrial and technical instructors.

Cordially,

Robert P. Van Tries
Assistant State Director
Vocational Education

RPVT/cak

APPENDIX C

10360 Wentworth Avenue South
Bloomington 20, Minnesota
May 5, 1964

Dear _____:

A statewide study is being made of the Minnesota T & I Day School instructors. It is hoped this study will provide the writer and other interested parties information that will give a clearer picture of the T & I teacher and his position in the vocational education program.

In order to accomplish this, I am asking for your help in the distribution and collection of the enclosed survey questionnaires. It would be greatly appreciated if each one of your day school instructors would complete one of the questionnaires. To expedite return of the questionnaires an addressed envelope is enclosed.

After the information has been tabulated I would be willing to send you a copy of the survey results, if you so desire.

Your immediate follow-through on this request would be appreciated in order that the study be completed as soon as possible, thereby giving us a current tabulation and summary.

Thanking you, I remain,

Cordially,

Howard E. Ernst

Howard E. Ernst

Number of T & I teachers employed_____

Number of questionnaires handed out_____

Number returned completed_____

APPENDIX D

10360 Wentworth Avenue South
Bloomington 20, Minnesota
September 28, 1964

Dear _____:

Last May a packet of survey questionnaires concerning day school trade and industrial instructors in Minnesota was sent to your school director with a request that he distribute the questionnaires, and upon completion, return them to the writer.

The percentage of questionnaires returned was good. However, the writer would like to increase the percentage of returns in order that the study be as accurate and complete as possible.

According to the writer's records you did not complete and return one of the original questionnaires. It would be greatly appreciated if you would take the few minutes required and complete the enclosed questionnaire, then return it in the envelope provided.

Thank you for your cooperation and prompt response.

Cordially yours,

Howard E. Ernst

SOURCE SHEET FOR SUMMARIES OF STUDIES IN INDUSTRIAL EDUCATION

(To be filled out, preferably by person making study, at time study is completed and checked by adviser; otherwise by adviser.)

Author ERNST, HOWARD, EMIL
(Last name) (First name) (Middle name)

Title PROFILES OF MINNESOTA DAY SCHOOL TRADE AND INDUSTRIAL TEACHERS IN THE AREA VOCATIONAL SCHOOLS
(Give exact title from title page -- also subtitle)

Degree granted M.A., Date 6-12-65, No. pages in report 88

Granted by University of Minnesota
(Name of institution)

Where available* Department of Industrial Education
(Source and address)

Purpose of study:

The purpose of the study was to compile statistical information about the trade and industrial instructors in the Minnesota Area Vocational Schools

Source of data and method of study:

Survey questionnaires were completed by the individual instructors of the Minnesota Area Vocational Schools. This information was tabulated and summarized.

Findings and conclusions:

At the time of the survey, May, 1964, the typical instructor was forty-three years of age and was in his present teaching position for four and one-half years. He taught six hours per day for ten months a year and had an annual income of $7,269. He did not participate in a registered apprenticeship program but had twelve and one-half years of trade experience. The typical respondent had a minimum of twelve years of formal education and held a five year vocational teaching certificate. He received his teacher training by taking on-campus courses for college credit and was continuing his education for professional advancement.

MF AVAILABLE IN VT-ERIC SET.
Pub Date - Jun67 131p.

*CHILD CARE WORKERS; *OCCUPATIONAL HOME ECONOMICS; PILOT PROJECTS; *PROGRAM DESCRIPTIONS; COOPERATIVE EDUCATION; HIGH SCHOOLS; LABORATORY TRAINING
FERNDALE HIGH SCHOOL; MICHIGAN

This document describes a 1-year pilot project for training high school girls for the occupation of child care aide. Of the 19 students enrolled in the program all but four had a 3-hour block. All students met for one class period 5 mornings a week for basic knowledge in child growth and development. Then, half remained in the child care laboratory school for two additional periods and the others reported to training stations, with attendance in laboratory or training alternated daily. Eight girls worked exclusively at their training stations, six of these worked in a hospital. Other training stations were day care centers, nursery groups, a Child Development Center (known elsewhere as "Headstart,") and health centers. The program and time schedule for the high school laboratory nursery as well as a sketch of the home economics facility are included in the document. The director reported that all of the trainees were employed upon completion of the course. Supplementary materials include samples of forms, descriptive materials (e.g. jobs, assignments, bibliographies), and student and administrative evaluation of the project. (FP)

W O R D S

...of Wisdom

The Honorable Lieutenant Governor of Michigan
William G. Milliken

"To make the most of a man
Broaden his horizons
Strengthen his spiritual fibers
and help develop his understanding
of self and others"

"National average shows that 35% of our high school graduates go on to College, 65% do not. These 65% need vocational training. When job is well done, it benefits students, employers and communities. Skills are essential BUT other qualities are ever more important: 'ability to get along well with one's fellow workers' 'the most precious thing in life--a being's personality' "

...that Challenge

Doctor Gordon Sabine, Michigan State University

Exerpts from a speech given by Dr. Sabine "...in summarizing feelings toward school by surveys of high school students, it was found (not surprisingly) that they wanted to be seen, noticed, heard, needed, loved, to be wanted, to like school.
These students claimed that:

1. most teachers lack time for slower kids
2. most teachers are crabby, better to smile
3. many give little encouragement
4. little interest in their students
5. begrudge any extra time they do give students.

and indicated that 'younger teachers' seem to understand kids better, seem to know 'we're' here to learn."

...to Reflect Upon

Doctor Kenneth Hoyt
Professor of Education
University of Iowa

"Vocational Guidance means helping people choose wisely from among alternatives. It gets the students involved in thinking and choosing. Counselors do not decide which is best, but they help students to understand completely and fully what alternatives they have and then help them choose for themselves. Most kids choosing vocational education are more apt to enjoy success than if on an Academic program.

We should accept their lower scholastic ability (if this is the case) without apology! Recognize differences between individuals and realize that some kids are better potential than their teachers!

Vocational education is ONE kind of opportunity for students, and the counselor helps them to see the alternatives of others. The process of making a choice is as important as the choice itself in the maturation of the student."

...of Happiness

Mrs. Theda Connell
Home Economics Vocational Coordinator
Ferndale High School
Ferndale, Michigan

"When one reads the words of Lieutenant Governor Milliken above, Drs.' Sabine and Hoyt, and realizes these challenges have all been met in a single class in a single year its been worth all the blood, sweat, and tears. The task was not simple. If I had realized in the beginning all it would entail, without the knowledge of reward and inner satisfaction it contained, I might have turned it down! How much I would have missed!"

The report is lengthy and actually designed for two audiences. Neither may read the report in it's entirety, but the facts had to be recorded for all those comtemplating such a program. To see the work involved without being able to read employer and student comments, and the reward they bring might discourage some educators from attempting the task, It is an area of occupational training that is needed and the opportunities are limitless.

F O R E W O R D

In November 1965, at the Annual State Meeting of the American Home Economics Association, attention was called to the Vocational Act of 1963 and it's implications for Home Economics Educators.

Education for employment at the high school level was very much needed not only by the students, but by the community. "...the many social, economic and technical changes that pattern our world give convincing evidence that specific preparation for work has become an increasing prerequisite for securing employment in semi-skilled, skilled or technical occupations, as well as in the professions..."

As your author listened to the various speakers on the wage earning aspects of Home Economics, an idea began to form. The Home Economics Department within her own high school provided an excellent facility, and opportunity for developing such a class. Also her background qualified her for the position of teaching such a class.

With the stimulus from the conference, and the enthusiastic backing of the Principal and Vocational Coordinator (later named Director of Vocational Education), plus the challenge of a new and exciting task--ideas began to germinate.

The following June (1966), recommendation for the adoption of a Vocational Childcare Aide Training Program was presented to the Ferndale Board of Education. Readers should be aware of some of the obstacles that had to be faced, so as not to be discouraged in the light of similar obstacles, in their respective situations.

In 1958, when the new high school plans were on the "drawing board", a very well planned and complete Child Study Center was incorporated as part of the Home Economics Department. The plans were designed by Mrs. Minnie Berson, at that time an Early Education teacher in the Ferndale School System, today with the Department of Education in Washington, D. C.

The high school was completed, but the facility not utilized as intended, as many considered it a "frill" and there was a movement in the community at that time toward a more conservative or basic curriculum.

Adding a third staff member to the Home Economics Department in 1965, with considerable background in nursery school procedures and child development, made the feasibility of using the "Center" possible. It was felt however, that the Board of Education would accept the plan only if it involved vocational training.

The State Meeting of the AHEA in November 1965 indicated the manner in which it might be accomplished. We had the vocational aspect, the physical facility and staff member to handle the program, plus a program that we felt the "Board" would be interested in.

Plans were drawn for the program by the Home Economics staff person to be in charge of said program, using materials from the University of Kentucky, and the Manpower Training and Development Office. The background of experience the staff member had gained in previous associations with nursery schools and a summer workshop at Wayne State University on "Teaching Home Economics for Wage Earning" seemed to provide the necessary background to launch the program.

A small scale survey by this staff member revealed a need for a program such as anticipated. It was approved by the Ferndale Board of Education in June 1966, pending approval of application for federal funds as a "pilot program", as we were to be the first Home Economics Department in the Stateof Michigan to have such a program. It was approved officially a few months later, and inaugurated in September 1966.

The resultant program has grown to momentous and unbelievable proportions today, June 1967. This had been an area heretofore untapped. No one foresaw it's full potentiality when the program was first suggested and planned. It serves not only a need of the employer, but a need for vocational training for the high school student unable to attend College, who enjoys working with people, not machines or merchandise.

Surveying the employment possibilities and lack of training for people in the Detroit Metropolitan Area, we soon realized it's possibilities. We were not however, prepared for the employers' genuine interest and eagerness to have such a program. It's reception was overwhelming and we were unable to fill the demand created, as employers learned of our program.

Indeed, the only persons seeming to question the advisability of such a program were (not surprisingly) the University Educators, who the author feels have misinterpreted what we are attempting to do. We are not training Nursery School Assistants (though many of the trainees could function well in this capacity) but Childcare Aides[1]. There is a good deal of difference between. An aide enables the employer to hire additional staff to give a better child/staff ratio and is not expected to assume the role of an assistant. She aides the assistant.

As this report is to be distributed not only to the State Office of Education, but to other interested parties, it was felt that an appendix which included some of the forms we've used, as well as exerpts of evaluations would be of value.

It has been an exhilerating year for all those involved and most rewarding.

COMMUNITY SURVEY

Mr. Luther Olson of the MESC (Royal Oak office) was very much interested in our program and was most helpful in suggesting people to contact. He indicated a need they could not fill for this type of trained worker. The Manpower Development Training Act (MDTA) provides funds for various programs, but none in this particular field in the state of Michigan.

Local babysitting agencies have indicated a great need for trained people to take over the later afternoon, dinner and evening hours. They have been unable to fill requests for any of these positions, as the women they normally employ are homemakers that wish to behome during the dinner hour with their own families. Local newspapers offer many positions for this type of work.

During the early promotion of the Headstart programs, the leaders deplored the lack of trained people to work in these programs.[1] The United Community Services (USC) of Metropolitan Detroit have indicated an interest in the program, and felt it was extremely important that we try to build a better image of the domestic worker, in order to attract more qualified people into this service. Pre-school education is advancing rapidly as the recognition of its' importance becomes more widely known, and adequately trained aides will be more and more in demand.

PART I

VOCATIONAL TRAINING PROGRAM FOR CHILDCARE AIDES

Ferndale High School

In planning the new high school in 1958, a Child Study Center was included in the Home Economics Suite. This facility was designed[1] to accommodate both indoor and outdoor activity areas.

Large sunny rooms were equipped with sinks, etc., for art activities as well as the larger motor activities. A smaller room for quiet play, with one-way observation glass between these two areas, and an outdoor play area with drinking fountain and storage for equipment used outdoors. This outdoor area is a court, surrounded on all four sides by windows of various classrooms and hallways, and is directly across the hall from the Home Economics Suite. Plans also included a kitchenette for food preparation and toilet facilities for the pre-school children, in addition to same for teachers.

---

[1]Appendix I, page ix, Floor plan of Home Economics Suite with sketch of Child Study Center included.

OBJECTIVES

The following objectives were outlined in the original application for approval of the program. Each is stated as in the original proposal and then evaluated.

1. To prepare trainees in all phases of childcare, including knowledge of not only the necessary skills, but also to develop an understanding of the physical, emotional, intellectual, and social growth and needs of the child at each stage of development; to better prepare them for employment in private homes, childcare institutions, group care centers, under the supervision of qualified childcare personnel.

Evaluation: This was accomplished very well with infant thru kindergarten age children. A great deal of knowledge was gained about adolescence, and early adulthood including the child-bearing years. The laboratory nursery was an ideal learning experience as the children, as well as their parents made fascinating subjects. They motivated the girls to read assigned materials and participate in class discussions in a meaningful way. EACH and EVERY girl participated in these discussions with a great deal of interest and knowledge. They literally "soaked up the materials available like a sponge!" It was a delightful experience for the instructor to have such an enthusiastic and interested group.
Time did not allow for real study of the six to twelve year old, which was part of the course.[1] It shall definitely be included this coming year, and is needed. One of our students is employed this summer as a Recreation Department "Storyteller" and had to do special study in this area.

---

[1]Appendix I, page vii, Course of Study

2. Provide laboratory for training a wage-earning service occupation, as well as utilizing same for students in other disciplines, such as biology and social studies, as they study human growth and development.

Evaluation: The laboratory nursery served the first purpose handsomely. It was not utilized by other classes this past year, we hope it will be next.

3. To evaluate the present facility as a laboratory for vocational training in childcare.

Evaluation: It is a well designed facility.[1] The only criticisms are:

1. kitchenette lacks an oven for "baking projects"
2. children's entry is within two feet of the Food's Lab which created some "noise" problems. One teacher complained, the other did not.

Both of the above will be improved upon. Everything else was ideal.

4. To test the use of a given block of time schedule. (See General Design page 5.)

Evaluation: Three hour block is a necessity if a laboratory school is included in the course of study. Conducting a lab school definitely helps instructor to discover girl's needs, both skills and theory.

5. To determine the kind of experiences and activities necessary for job success.

Evaluation: This is best done by employer surveys and operating a lab school within the high school building. Very definitely the girls that participated in the lab school as well as CoOp received the better training, and were the easiest to place.

---

[1] Appendix I, page ix, Floor plan of Lab Nursery.

6. To try some pilot programs in CoOp where students will be working part time at training stations, such as nursery schools, hospitals, day care centers, while at the same time providing related instruction in the area of childcare and development.

Evaluation: We did. For descriptions of same, refer to Section II of this report.

The pilot program proved to be successful in each area tried. It would appear however, that training for hospital work should be a separate class. Giving students an experience in the nursery school along with their hospital training would be ideal, but proved impossible for us to accomplish. In attempting to please the hospital, we actually sacrificed some valuable experiences that the girls should have had at the high school. Our instructor suggests that the girls work after school at the hospital, and remain in the nursery lab mornings, if such a program is contemplated.

1. GENERAL DESIGN

Original Plan: Twenty students meeting for one class period five mornings a week for basic knowledge in child growth and development. They will divide into two groups. Group I remaining in the laboratory for two additional periods, while Group II report to their training stations. The students will alternate their schedule--

Group I -- 2 days in laboratory, 3 days at training station.

Group II -- 3 days in laboratory, 2 days at the training station.

These groups will reverse their schedules midway in the year-long program. Groups I and II will be selected and assigned at random. We will compare the performances of both groups as to which of the training experiences is superior, the training station or the nursery school lab experience. We will also determine if the extra day spent in the lab by Group II makes a significant difference in the performances at the training station.

Problem: Counselors had placed 19 students in program--only five in required 3 hour block--five in first and second hour, nine during second and third hours. In order to operate our laboratory class for minimum of 2 hours per day, and also class meet for one hour, it was necessary to have all students in our Child Development Theory class during third hour.

Solution: Girls agreed to give up study halls and arranged their schedules so that all but four were available during the entire 3 hour block. The remaining girls were placed in the second and third periods--so that a complete class could meet third period daily.

Evaluation: This worked perfectly, though we were sometimes short of help first hour of nursery school.

2. TIME SCHEDULE

Original Plan:	8:50 - 9:45	Class in Child Development
	9:50 - 11:45	Report to Nursery School Lab/ or Training Stations

Problem: Some employers wanted girls 7:30 a.m.--some as late as 9:30 a.m. Necessary to be back in school by 11:42 a.m., not allowing enough working time for girls starting later.

Solution: After several weeks of trying to operate effectively with above plan (unsuccessfully) we changed girls' schedules. They reported for Child Development Theory class only one day a week, (Friday) for three hour block (related instruction), thus alternating 2 full mornings at their training station and 2 mornings in our laboratory school... with nursery school laboratory in operation 4 mornings a week.

Problem: Arose when six of the girls entered the hospital training program and hospital required five days a week attendance.

Solution: During training period, which included written work at hospital, we excused them form all class work.

Problem: This proved to be an unwise decision, led to break in communications as teacher-coordinator lost all contact with girls, resulting in alienation of nursery school group and hospital group AND the hospital group with other teachers. Conflicts arose when girls reported to fourth hour class late, instructor refusing admittance on the grounds the girls were taking advantage, etc. and the girls complaining of this instructor to those in charge of the program at the hospital--leading the hospital administration to believe our high school staff were uncooperative.

Solution: After several weeks during which teacher-coordinator discovered mistake, an attempt was made to have girls report once a week for after school class.

Problem: Girls resented this, feeling they were working very hard at the hospital and desired freedom the nursery school girls enjoyed (whom they felt had the easiest job).

Solution: Contacted the hospital Administration and asked that girls be released on Friday a.m. to join the rest of the class (to which they all agreed) placing these girls with student teacher who arrived their first week back in class. They appeared to like her very much BUT never really participated in the nursery program. We lost them--as far as class participation went. They remained enthusiastic about their hospital work and all are continuing in this field. While our original objective was not completely realized, the consequences were still good.

Evaluation: Worked very well, though girls suggested that class meeting for two mornings rather than one would give them more time to complete assignments. They did have thirty minutes at end of nursery school on days they were in lab, but these times were used for evaluation and planning. Perhaps this time might have been utilized somewhat for written work, but instructor felt it was very valuable in the girl's training when used as it was.

3. PUBLICATION OF RESULTS

Suggested: Periodic evaluations were given orally to the superintendent, principal, Director of Vocational Education. Contact was frequent with the Home Economics and Family Life , State Office in Lansing.
Final summary report to be submitted to the Ferndale Board of Education, Division of Vocational Education in Lansing, and other interested school districts.

IMPLEMENTATION

Teacher-Coordinator was to implement the program with one assistant and also be responsible for coordinating training stations, and instructing students in the related childcare class. This was to be a one year program, commencing September 1966 thru June 1967.

All but four of the nineteen students enrolled in the Vocational Childcare Class were in the three hour block. Schedules were set up, with girls alternating their days in the laboratory with those on the training station. Eight of the girls worked exclusively on their training stations. Six of these were hospital girls.

It was decided by the Board of Education that funds would not be available for an assistant teacher in the nursery and the one instructor handled the entire program[1] alone. It was an enormous task for one person to handle, but extremely rewarding to that individual. It is recommended that unless a prospective teacher has a comparable background[2] of experience, that she not attempt the program without a trained assistant.

The program was started on schedule, with class meeting daily for three hours of orientation. This included many field trips and outside speakers. Middle October found the girls and the employers most anxious to get training stations started. Several of the girls started their CoOp experience at that time. By November 1st, all those going on CoOp were working.

The laboratory school opened November 10th. There were a total of fourteen children enrolled. The nominal tuition ($40 year) was used to purchase the snacks, craft materials and partially reimburse students for expenses involved in workshops.

---

[1] Appendix I, page xiii, Responsibilities of Instructor.

[2] Appendix I, page xi, Background of Ferndale Instructor.

The nursery (lab) was closed on May 18th, after a very successful year,[1] and the girls returned to the high school, giving up their CoOp employment, or working outside of class hours.

As of June 10th, 1967, all girls had been placed[2] on jobs for the summer and/or Fall.

---

[1]Appendix IV, page xxiii, Evaluation.

[2]Appendix I , page xvi, information within parenthese.

PERSONNEL:

1. Name of Project Director: Mrs. Theda Connell

2. Statement of previous experience:[1]

The laboratory assistant position was not filled due to budgetary reasons. This proved to be a mistake, for an assistant is quite definitely needed if the task is to be accomplished well. During the second semester as things became more organized, one of the nursery students assisted the project director (who was also the teacher of both the pre-school children and the high school students, as well as coordinator) for office practice credit every afternoon for one hour. She was of tremendous help, although the instructor still found it necessary to work an average of four hours a day in addition to her regular schedule, in order to keep things working smoothly. While the teachers are excused from the building at 3:35 p.m., this teacher found it necessary to stay usually until 6:00 p.m., and then take work home with her for the later evening hours. Hopefully during the coming year, a part time assistant might be possible.

BUDGET:

Salary of project director	6154.03
Clerical Salaries	362.00
Travel allowance 643.4 miles	51.47
Equipment and supplies for nursery	1126.20
Office supplies (including report)	402.00
Postage supplies (including report)	80.00
Phone	80.00
Printing and Duplicating	190.00
TOTAL	8445.70

SOURCE OF INFLUENCE

The school was open to visitors at any time, by prior appointment. The instructor giving up many lunch hours in order to speak with them, if they were unable to stay through for her conference hour. The following is a partial list of people visiting the program.

John Houghton, Superintendent of Ferndale Public Schools
John McGregor, Principal of Ferndale High School
Fred Wagner, Assistant Principal of Ferndale High
Irving Rosen, Director of Vocational Education

Ferndale PTA Council Tour)
Advisory Committe Tour) School not in session for thes

Mrs. Thelma Graper, Consulant in State Office of Home Economics
Mr. Charles Langdon, Administrative Assistant, State Board of Education and others from his office.
Visitors from Holly, Michigan...neglected to write down their names!
Vocational Director's Association of Oakland County (several appeared very interested in our program and asked many questions).
Miss Majorie Trott (Detroit Public Schools, Director of Voc Homemaking) Also an architect for the Detroit schools. They were seeking ideas on designing a Child Study Center.
Miss Virginia Conlon and a member of Oak Park Board of Education for same reason stated above.
Miss Ann Neely, Pontiac Northern High School Home Economics Teacher (looking for ideas for three week program she was going to have. Two of our girls went out to help her with it for three days at the start).
Miss Carol Irish, Pontiac Public Schools, Home Economics Coordinator.
Two visitors from Hazel Park system, operating a program a bit different to ours.
Miss Barbara Gaylor, Chairman of Home Economics and Family Life Education, State Board
Mrs. Eleanor McCrimmon, Consultant on Wage Earning Programs (above department).

Miss Gloria Patty, Mount Clemens High School
Mr. Earl Halvas, District Office of Education
Mr. Bomark and also the Assistant Superintendent of Farmington Public Schools.
Mrs. Sharon Petty, Diagnostician for Ferndale Schools
Dale Flynn, Economic Opportunity Office (Ferndale School District).
Consultant (Business Education) from State Board of Education (May 17).
David Soule, Consultant on Intermediate School Districts of Oakland County.

PRESENTATION MADE TO VARIOUS GROUPS
DURING THE SCHOOL YEAR

Five minute presentation to Ferndale PTA Council in September.

Five minute presentation to all students in the 9, 10, and 11th grades assembly.

Five to eight minute presentation to State Conference of Home Economics Teachers at Traverse City (perhaps 500 present in all) in November 1966.

Twenty minute presentation to Home Economics Teachers of Royal Oak, Michigan at their Curriculum Meeting in May

Weekend serving as a resource person at a Michigan Migrant Opportunity Office Workshop, for training those involved in working with Migrants. (May)

Ideas on what we're doing at the Oakland County Head-start Teacher's meeting in Pontiac in February.

Attended several Macomb, Oakland County Coordinator's Meetings and spread the word when seemed appropriate. (Never a formal presentation).

Article in Preschool Association of Metropolitan Detroit Newsletter (received several employment leads from this).

Article in Ferndale Gazette, School newspaper, Royal Oak Tribune and a wonderful write up in the Detroit Free Press on our program, which also netted us several calls. The latter was a concluding article to a week long series on Daycare Centers, their problems, shortages of staff, etc. Headline on our article was "What One School is Doing About It".

Pictures in the brochure developed to promote Vocational Education Area Schools in Oakland County.

Attendance at week long Vocational Coordinators Conference at Leland to spread the word. Only three representatives of Home Economics there, no opportunity for formal presentation, but several opportunities to explain to various groups a bit about our program.

Ben Hamilton, Consultant on Elementary and Secondary Education, Michigan Board of Education. (private consultant while in Lansing).

Mrs. Minnie Berson, U.S. Office of Education, Washington D.C. (chatted together in April).

ADMINISTRATORS COMMENTS AND EVALUATIONS

"...fine work you are doing for our students in the new vista opening before them--employment opportunities and a rewarding experience in the service of children; to name a couple of important outcomes--I feel that your assignment and your success in it are important factors in our endeavor to combat the drop-out problem."

John Houghton
Superintendent

"The Vocational Child-Care Program initiated by Ferndale High School during the summer of 1966, was the most outstanding initial cooperative education program I have seen. The program served the needs of those students who have been disenfranchised from other cooperative programs by reasons of ability and motivation. This program created a "spark" in the girls involved and motivated them toward achievement. I feel that these are the kinds of programs we should be looking toward in the future, as many of our students will be involved in service type occupations."

John D. McGregor
Principal

"Last year the school board approved a Vocational Childcare program on a one year pilot basis. At present the program has been very successful. All of the graduating students have been placed on jobs resulting from their training. Many neighboring schools have indicated they will emulate our program. Employers, students, as well as parents of the nursery school children have expressed in their evaluations that they regard this program very highly."

Irving Rosen
Director of Vocational Education

"The Childcare Vocational Program at Ferndale High School provided an opportunity for some students to find their only success in high school. The coordinator with her interest in her subject matter and her knowledge of her students was able to infect them with enthusiasm for their jobs and their class work. The students had the advantage or careful observation and guidance. Most found the work rewarding and their relationship with the coordinator and their employer will help them to be better parents even if they do not continue in childcare work. This program is an unlimited value both vocationally and socially.

Mary Smith, Counselor

E V A L U A T I O N
C O M M E N T S

Project Director

When this program was first proposed, we envisioned training girls to work in homes and childcare institutions. There is still a very great need for this type of worker. However, thanks to Miss Majorie Trott, of the Detroit Public Schools, we were made aware of another great need. There are dozens of nursery schools, nurseries and daycare centers in the Detroit Metropolitan Area. It was her suggestion that we explore the possibilities of training girls for work as aides in these situations that elevated our program to a higher level of achievement.

Of the dozen or more employers contacted, all but one expressed a great deal of interest and enthusiasm toward our program. When it was realized that we could train girls for these positions and they would be paid $1.25 an hour during their training and possibly $1.75 an hour upon completion of same, we changed our early objectives somewhat.

When Miss Trott remarked to me last October that this was a far more ambitious project than any of us appeared to realize at the time, she was certainly a prophet or foreteller of good fortune.

The really thrilling part of the whole project was the girls' enthusiasm and how very hard they worked. They had inner goals and certainly the inner drives are far better than outward pressure. The girls were told at the beginning of the year what would be expected. From time to time, reminders were made of work that was due. For the most part however, there were no deadlines for assignments due. The girls turned in their work when completed. Some turned in far more than others. Some of the poorer (?) students turned in far more than some of the brighter, and conversely. They were not graded so much on what they turned in (though this did of course count), as on the way they performed in the laboratory and their contributions to class discussion.

As each and every girl felt very free to speak up in the informal atmosphere of the nursery, it was felt by the instructor that this provided a most unique and accurate evaluation of girls' knowledge. Great changes took place with several of the girls, and certainly all grew in the areas of intellectual and social, as well as emotional understanding.

The majority of the class were motivated (inner motivation again) to attempt to continue their schooling in the area pursued. Certainly this points out a real need at the Community College level, for this type of training, along with additional liberal arts background. The aides should not replace assistant teachers, but supplement the nursery school staff.

I could not close without thanking all those responsible for the success of our program. The girls, their employers who were so very interested in our program and the personal interest they evidenced over and over again. My fellow coordinators, administratora and parents, I could ask no more, they were all so generous in their support. Certainly those in Lansing who had enough faith to extend financial aid also deserve to be thanked and last but not least, our Board of Education, who had the courage to try the program in view of earlier happenings.

Their continuous support has been most gratifying.

Theda T. Connell

(Mrs.) Theda T. Connell

PART II -- Section 1

DAY CARE CENTERS

There were four students involved in day-long[1] care for children of working mothers. Two of these students were employed in the mornings. They were there to greet the earliest arrivals at 7:30 a.m. The daily observations written by these students showed their compassion for these very young children who had to leave the comfort of their bed and "mama" so early in the morning.

One of these students wrote 123 observations! As student folders were organized toward the end of the school year, as to child and date, this student's papers revealed wonderful growth of not only herself but her charges. This student came from an ADC home--she was not afraid to work and always went beyond the call of duty. She lacked confidence at the beginning of the year to go on a job. After several weeks of orientation and observation and instructor's promise of being placed with a very understanding employer, anxious to help her succeed, she decided to try it. She did so well that she surprised everyone by announcing at the end of the year that she would like to go on for more schooling (two years of Community College) and someday open her own Day Care Center, with her mother's assistance. The Community College may be a difficult task, but her determination to succeed and willingness to work hard, will carry her thru.

Her partner on the job did not fare as well. She was a very disturbing girl, willing to work very hard if she was interested and really quite capable, but poor personality. The instructor faced a real challenge in accepting her in the program. It was felt that she might have a chance of success here where she had failed miserably in other areas. "This is our last resort, maybe you can help her." (Counselor's Comment!)

---

[1]Appendix IV, page xii, Employers B and C.

The instructor gave this girl much more freedom than the rest of the class but set clearly defined limits. The student was a fairly frequent visitor to the instructor's home and enjoyed her special privileges. She worked so hard in her nursery job that she was given an "A" for the marking period. She couldn't believe it. It was probably the first "A" earned in years, if ever before. Problems arose when she failed to report for any class but the nursery school. When this was recognized and brought to her attention, she was very flippant about it. She could not be trusted to be where she was supposed to be--even in the nursery school. She caused so much dissension at her place of employment, it was suggested she be removed and have the opportunity for more closely supervised instruction at the high school. The relationship at home was not good and when the father remarried early in the spring, she quit school and joined the Women's Army Corp.

These students had both been involved in a very excellent Day Care Center. The other two students were less fortunate.

The second situation was also a daylong program and these girls reported after school. The pre-schoolers, (many having been there since 6:30 a.m.) were less easy to manage. The center was short-staffed and the girls were given too much responsibility for their level of maturity. One girl left after a few months and when conditions became intolerable for the remaining girl who remained "stoic" to the end, it was discovered that the center was violating many rules of their license. The student was withdrawn immediately and the center will no longer be used as a training station. This was an extremely unfortunate situation. The nursery had been in operation for several years and changed ownership at the time training stations were sought. It was fresh and sparkling in appearance, the director a former elementary teacher and close to the high school. It looked promising. The "office" to which the Coordinator was admitted on only a few occasions was at the entranceway and as the student always worked outside, it was not realized by the Coordinator the condition of the interior. The Coordinator regrets very much having neglected her responsibilities toward the situation sooner, and draws readers' attention to the fact that in our area of vocational training we MUST check the facility regularly or withdraw students if employers make this awkward to do. (Which was the problem with this employer).

There will be an increasing demand for people trained in this area, as new centers open. We could not accommodate the need of the employers in this area, due to the inadequate transportation and our half day CoOp program. Running two sections, one in the a.m. and one in the p.m. would have helped, but can only be done if a second instructor can be found.

PART II -- Section 2

NURSERY PROGRAMS

There were four students involved in two morning[1] nursery groups, both licensed as Day Care Centers. The one was privately owned, the other a Cooperative owned and operated by a parent group.

The former schools' owner-director was a wonderful stimulus to the program, being our champion promoter![2] She had many ideas and made her demands on the girls she employed so flexible that we could change their schedules whenever we felt the need without inconveniencing the employer. She is converting the nursery in which the girls worked to a daylong program, along with another nursery she operates. She will be opening a third facility in the Fall of '67, and has indicated a need for several of our girls--both fulltime and CoOp students.

The Cooperative Nursery was an excellent experience for two of our girls and it delighted the class when the Cooperative Nursery group reversed their earlier decision and decided to pay Patty after all.[3]

The second girl did not work out as well--she was a potential drop out and though everyone encouraged her, she was absent a good deal. Little cooperation from her family. She did gain a great deal from the class, however, and realized this. In her own way--she did try very hard.

Her counselor and instructor were most understanding and helpful and her employer very sweet, all made an impression. While she was the only girl not recommended for a nursery position at the end of the program, she would work very well in a private home (except for absentism) and was recommended for same. At last check (she had not reported to a very interested employer as she had indicated she would. Promises are easily made by this student and then forgotten).

PART II -- Section 3

CHILD DEVELOPMENT CENTER

One girl was employed by a Child Development Center[1] within the school's own district. These programs are commonly referred to as "Headstart", though technically "Headstart" is the summer program.

Politics entered into this placement to quite an extent. The Coordinator was referred to the person in charge of hiring personnel for this program. This man has the joint title "Director of Elementary and Secondary Education Act Programs" and "Coordinator of Federally Assisted Programs". The Principal in whose building the Economic Opportunity Offices are located, would have preferred the original contact be made through him. Any one contemplating such a program should check the protocol in their own district for handling matters such as these.

The Coordinator had more difficulty selling the program with these people than with any of the private employers. This was partly due to government restrictions on "who" can be hired for these positions, but also she felt lack of awareness of importance in having "trained people" working with young children. This, of course, has been one of the biggest criticisms of those involved with pre-school children. Many persons feeling training for work with these "little ones" is not that important, but can be gained on the job. As one director of such a program stated.[2]

PART II -- Section 4

HEALTH CENTERS

As the literature suggests that Child-care Aides might work effectively in the health care area, we were anxious to include this experience in our pilot study.

We discovered that nine of the class were very much interested in this phase of the operation. Providence Hospital accepted eight students which was a very valuable part of our program.

Two of the girls had their first exposure to the health service area with the Oakland County Health Department's Well Child Conference. This was on a voluntary basis one morning a week and involved primarily clerical work, checking family records for immunizations, etc. Had this continued longer (girls were switched to the hospital after just a few weeks) it would have involved more of the actual health routine.

HOSPITAL PEDIATRICS

As the literature on the subject suggests that Childcare Aides might work in pediatrics, we were most anxious to try this in our program.

In July 1966, Mrs. Connell, High School Teacher-Coordinator, approached the nearest large hospital, which happened to be a "teaching hospital", and proposed our program to Mr. Lawrence Severin, Director of Nursing Care Services. He suggested we talk with the supervisor of the Pediatrics Division of the hospital. At first she seemed not too interested, but warmed up to the idea as we talked. She said we would have to convince not only Mr. Severin, but Sister Ambrose, the Head Administrator of the hospital.

Mr. Severin indicated that he would approach Sister Ambrose, and for several weeks we were in suspense about the matter. In October, the teacher-coordinator contacted Sister Ambrose and arranged for an appointment with both she, Mr. Severin, and Mrs. Mary Morris (Coordinator of the CoOp students). They indicated interest in the program, but suggested it would be too specialized. Also shared their problems in regard to budgeting. It was suggested the girls were so enthusiastic that they would accept whatever conditions the hospital outlined, including general hospital work, rather than strictly Pediatrics, and on a voluntary basis, rather than on a paid. The girls wanted so very badly to get into the hospital.

These suggestions were discussed very carefully, and a few days later, the hospital notified us they had decided to participate in our pilot program. They explained that their budget allowed only twelve CoOp students. They had committed themselves to taking Southfield High School students, as the hospital is located in Southfield. The decision was made to set up a separate training program for the Ferndale girls, and eight were accepted. A twelve week training program was to be developed for these girls in the hospital under the direction of Miss Helen Murphy, R.N., Instructor in Nursing. They were to be paid $1.25 an hour during training, $1.46 upon completion of same.

The Teacher-Coordinator suggested Mrs. Morris might like to interview and screen the girls before class started. Mrs. Morris suggested that all of the girls expressing interest in the program be assigned to the class. The girls ranged in ability from an Intelligence Quotient of 80 to 124. They volunteered that the lower ability students oftentimes function better as nurses aides than the higher ability student who might be inclined to make decisions and take action which they have not been trained to do. The teacher-coordinator was later to regret this decision.

Two of the lower ability girls were pregnant, unbeknownst to the high school staff at the time they entered the hospital for their training. One in her third month and the other in her fourth month of pregnancy.

The hospital discovered this before we did and would have continued the training of these girls with their doctor's permission. The girl's delay in doing so, caused them to be dropped from the training. The in-service coordinator and the instructor at the hospital both indicated that less than half of this group would have been retained as employees more than two weeks, had they been hired thru regular channels. These girls were definitely given help they very much needed, and it was unfortunate that the two above girls could not continue.

At the mid-term evaluation the girls were thoroughly evaluated by the in-service coordinator, Mrs. Morris, and Miss Murphy, their instructor. It was mutually agreed that all of the girls had made great gains and were operating at about the average level of effectiveness. A few were operating above.

In the final evaluation of these students, Miss Murphy had been replaced by Miss Judy Cox, who generally agreed with Mrs. Morris's oral report on the progress of the students. It was felt that the students were operating at an "average" to "good" level of effectiveness and that all of the students had shown tremendous growth, in their seven months at the hospital. In seeking their opinion as to which student had shown the greatest amount of growth (as a possible recipient of the Vocational Homemaking Award), one indicated Renata C., and the other Brend M.*

*Brenda, complete loss of vision in one eye and only partial in the other, was highly praised by hospital staff.

These two girls have both chosen to go on for additional schooling in nursing. It was indicated by Miss Cox that there was not a girl among them that would be satisfied with this low level of nursing, and predicted that all would eventually seek further training in patient care.

It was felt that specialization[1] at this level by childcare aides was not appropriate. Aides being better utilized in the general clincial areas of the hospital. Hospital needs fluctuate from day to day and hour to hour making it desirable to have a greater mobility of this level of worker. It was suggested that a hospital such as Children's and childcare institutions such as the Sarah Fisher Home or a facility for handicapped children might better utilize the services of a childcare aide than a general hospital.

The last point discussed was the apparently lower academic level of the Ferndale students as contrasted with those from Southfield. It was suggested by the high school coordinator that girls could have been selected from among the higher academic levels, and that perhaps the school had erred in sending the lower ability students. The hospital staff denied this, saying that "dedication to the task is more important to us than the academic level of the student."

Certainly there could not have been a more dedicated[2] group than these girls from Ferndale who embraced their responsibilities with a great deal of sincerity, human interest and dedication. We are pleased that they enjoyed such success at the hospital, albeit they didn't prove the hypothesis we had researched. But this afterall, is the purpose of research. Upon reflection, and in consultation with other teachers involved in Vocational Training for Health Services, the conclusion has been reached that the high school would do better perhaps to furnish their own nurses aide training program, and then send students out to convalescent homes and small hospitals that do not have their own "teaching" program.

---

[1]Appendix IV, page ii, Letter from in-service coordinator.

[2]Appendix IV, page xxxx Girl's Evaluations.

For those interested, there are funds available apparently to pay an instructor at the hospital for this training. Check with the person in charge of Federally Assisted Programs in your school system.

We're pleased to report that the health service field was and will continue to be served by these students as the six completing the training all plan to continue.[1]

---

[1]Appendix I, page xvii, Girl's plan for the Future.

PART II -- Section 5

FERNDALE HIGH SCHOOL LABORATORY NURSERY

Home Economics teacher with extensive background[1] in nursery school procedures and child development planned and executed the program. It must be emphasized that background[1] of experience in nursery school work is absolutely essential. The responsibilities[2] are four fold and very complex for one person to handle.

It was decided by the Board of Education (upon learning the program would not be 100% reimbursable) to eliminate the assistant that had been planned earlier. This meant that the Home Economics Instructor would be directing the nursery school program as well as supervising the students. She also assumed the role of Vocational Coordinator which added vocational counseling, locating of training stations (places of employment), placing students on these stations and following up with evaluations[3] of same.

This same person also interviewed and selected[4] the pre-school children and their parents, which would be participating in the program. Considerable time was devoted to this procedure. After the initial telephone contact, a personal interview with the child and one of his or her parents was arranged. The interviews lasting from thirty to sixty minutes.

This interview not only gave the instructor an opportunity to explain the program, but also to discover something of the parent-child relationship and the childs' adaptation to another adult in new surroundings. It also gave the child an opportunity to explore the nursery without the competition or possible threat of other children, and his parents an opportunity to become acquainted with the teacher and program. Notes were made after every interview and placed in the child's personal file where subsequent observations of the child were placed by students and teacher.

---

[1]Appendix I, page xi, Background of Ferndale Instructor.

[2]Appendix I, page xiii, Responsibilities Assumed by Instructor.

[3]Appendix II, page i, iv, Samples of Forms Used.

[4]Appendix II, page iv, Criteria for Selection.

Twelve children were accepted--of these, six were girls (three 3 year olds and three 4 year olds) and six boys (three 3 year olds and three 4 year olds)...only one of the children had had an earlier nursery school experience. Later two additional boys (one 3 and one 4) were added to balance out the personalities of the group. Nine of the fourteen children came from families with four to twelve siblings, average family having six children.

The program was planned within the framework the instructor had worked with at the Wayne State University Home Economics Nursery. It was a very flexible and for the most part an unstructured program.

Time schedule was along the following lines, but flexible and modified to suit the occasion.

8:30 - 8:45	Instructor checked over plans for the day.
8:45 - 8:50	Students arrived and start working. Rooms set up for daily program by students assigned to various areas.[1] a. craft activity table b. paint easels prepared c. paints mixed (if necessary) d. playdough out (mixed-if necessary) e. gym equipment out f. housekeeping corner checked g. groceries put away (after shopping had been done) h. fresh fruits and vegetables washed and prepared for later serving i. quiet area set up--books, phonograph, puzzles, etc.
9:00 - 10:30	Flexible program with both indoor and outdoor activities. Children chose their own interest area. Snack was available from approximately 9:45 until 10:15, children choosing the time they wanted to eat, and friend or friends to eat with. Sociability was the keyword.

---

[1]Appendix III, page iii, Area Descriptions.

10:30 - 10:45	Musical games, songs, finger plays to gather children together for a storytime. Different methods were used for story telling: reading, flannel board, "telling" puppets, etc. Sometimes older children told a familiar story. Next year will attempt to spontaneously dramatize stories.
10:45 - 11:00	Winding up the morning... might continue storytime, etc. or dress to go outside.
10:55 - 11:00	Mothers arrive to pick up the children. They have been very prompt on all but a very few occasions.
11:00 - 11:10	Complete cleanup of nursery.
11:10 - 11:30	Evaluate morning sessions.
11:30 - 11:42	Greet returning CoOp students (from training stations) and reviewed plans for next day in nursery.

The first semester the girls chose the area they felt most comfortable working in. This had been suggested during the survey[1] by the employers. However, we had a few girls with employers who felt the girls needed help in areas other than those chosen. There were also a few girls who felt they were doing all the work, and there were a few that had to be reminded what their duties were. We were over-staffed in some areas, short in others.

The plan that the girls embraced very enthusiastically was inaugurated at the beginning of second semester. Recognizing the problems described earlier and also feeling that the girls needed to develop skills in all areas, a new plan[2] was devised by the instructor.

---

[1]Appendix III, page i, Employer's Job Description.

[2]Appendix III, page v, Assignment Sheet.

There were four areas and eight girls. There were four months remaining in the nursery school program. Two girls were assigned to each area, with jobs rotating every four weeks. This gave everyone an opportunity to develop in all areas, it also satisfied everyone for they soon realized that a person assigned to a particular area had definite responsibilities and did not leave an area without director's permission. The three hour block girl was considered the key person in the area, and the two hour block student her assistant. The teams were each composed of one two hour and one three hour block student.

There was a tendency for the two hour student (with this plan) to feel she was being used only for cleanup activities. When this was realized by the instructor, appropriate changes were made to the satisfaction of all concerned. The girls definitely preferred this more structured approach, as it appeared to be a fairer distribution of the work load.

Lest the reader reach the conclusion that the second method be the ideal, it should be pointed out that the girls gained a great deal of confidence in working with young children, during the first method used, as they worked in the area they felt most competent in. Perhaps a shorter length of time for the first method would be in order. It was considered valuable by the instructor. It must be remembered that many of these girls, in fact, all but two were quite uncertain of themselves when they started the course. They were not only uncertain as to what was expected of them, but many had very little self-confidence[1] in front of others.

The approach used in the classroom, as well as in the nursery school was one of informality, suggesting rather than demanding, stress being always on trying to understand the other "person's" problems and behavior, as well as one's own. Teacher always pointed out her own mistakes in the evaluation sessions and these were discussed by the class as thoroughly and completelyas those made by the students.

---

[1]Appendix IV, page xxiv, xxix, Student X, and Student VIII.

An additional comment on the time required by parents, visitors, and student teachers.

During nursery school session, the children's needs and feelings always come first. The high school students recognized and accepted this very well. The parents, for the most part, did also. When parents or visitors were present, it was suggested they sit or stand behind the one way observations glass. A student was put in charge and the instructor joined the parent or visitor for as much time as appeared available and desirable.

Contacts were made by telephone, initiated by the teacher, sometimes by the parent. If the matter seemed rather urgent, evening calls were made. Two parent meetings a year seem advisable. Possibly an orientation meeting in the Fall and another meeting in the Spring. Ferndale had a "Parent Night Potluck" the third week in May and it proved to be extremely successful. Highlight of the evening were five rolls of movie film taken of the children during the school year. The students also gave short presentations on various aspects of the program. Each student choosing area in which they felt most confident. These were so well done (only two girls felt it necessary to "read" their presentation) that they delighted the parents of the nursery youngsters as they did the instructor.

As the parents' evaluations[1] show, they were as pleased with the growth of the high school students as the school personnel.

Visitors from other schools interested in the program were frequent and often these people stayed for the entire day, enabling instructor to explain the program to them and allow for questions, neither of which could be managed well during nursery session.

Student teachers should quite definitely not be part of the program during the first year. The instructor regardless of how strongly tempted, should not accept a student teacher. It is not fair to the high school student, the children, the teacher or the student teacher. There are enough complexities to be worked out, without this added one.

---

[1]Appendix IV page xxiii, Evaluation by Nursery School Parents.

The second year, it might be considered, but better for all concerned if during the fall term so as to be there for orientation along with the rest of the class. Definitely inadvisable to accept any student teacher lacking University Laboratory Nursery experience.

The instructor in our program did so and found she was unable to turn the program over to the student teacher, due to lack in her background. Operating a nursery, even within a high school setting is a tremendous responsibility and the rights of the little ones must be respected. The philosphy of this particular student teacher toward little ones was not in keeping with child development theories and practice. It was partially due to this experience that the instructor became convinced this type of vocational training should not be attempted by anyone without the background recommended.

RECOMMENDATIONS
RELATING TO INSTRUCTOR COORDINATOR

Actual work experience in a nursery school is a necessity. In order to qualify for any vocational training certificate, one must have a minimum of two years work experience in the area in which they expect to teach occupational training. It is possible in our area of Home Economics to have this waived somewhat. DO NOT BE TEMPTED! One needs this experience to run a successful program if a laboratory nursery is involved. We must not exploit pre-school children. One must be aware of what a good nursery program is and have extensive background both in theory of children's behavior and actual work experience with groups of children, applying this theory! A minor in Nursery School Education would be excellent and is I believe a possibilty under existing state certification regulations. Check with the Certification Office or Department Chairman of your particular University.

Recommendation of courses that would help in setting up a program:

Early Childhood Classes (giving nursery school laboratory experiences)

"Wage Earning Workshop" in Home Economics.

"Coordination Techniques" such as:
"Principles and Practices of Coordinating" or
Industrial Education 6189 CoOp Occupational Education at Wayne State University

VERY VALUABLE to attend the Vocational Coordinator's Conference at Leland, Michigan held in June of each year.

OTHER RECOMMENDATIONS

1. Three hour block of time for class. Less short changes students, employers, and children.
2. Two hours for instructor for planning and coordinating. Three are now being recommended by Vocational Education people...and would be preferred. Definitely a minimum of two hours is needed, and they should come together at the end of the school day.
3. Make certain your program is well represented on the local Advisory Committee for Vocational Education. Check into possibility of having a subcommittee for just your program.
4. Avoid Coordinator's Pitfalls.[1]
5. Do not abdicate student's program needs to "win" a training station, regardless of how desirable that station may appear.
6. Exercise extreme caution in placing a student on a training station where the supervisor of said student is less than enthusiastic!
7. Do not place a student on a training station if you would hesitate to employ them yourself.
8. To help shy students by accepting them in the program is fine, do not accept students that appear to have deeply rooted emotional problems. We are not diagnosticians, nor psychotherapists. It is not fair to the pre-schoolers to have such people in the program.
9. Plan with the employer, the student's responsibilities, having a well organized and instructive related study program. If the employer disagrees, find another employer! By this, it is meant that if employer refuses to help plan the learning experiences, this will probably not be the type of training station that will best help the student.
10. Visit CoOp work stations periodically, every 4 to 6 weeks in person. Occasional phone calls when need arises, but do not substitute by phone the personal visits.
11. Be very careful in placing the low ability students. Some employers pay lip service toward willingness to take same, but in actuality (in our case at least), this became quite an issue. The supervisor of said sutdents making constant reference to their low abilities, and then refusing to accommodate a group the second year. These are the girls that may be able to function well in a home setting, rather than in a hospital or nursery situation. (The nursery people are actually among the more understanding employers, and may be willing to give these girls a real chance of success, by giving them very routine type jobs.

Appendix I, page xvi, Coordinator's Pitfalls.

Avoid placing the really low ability students in a hospital training program, unless the training all takes place at the high school.

12. An afternoon CoOp should work as satisfactorily as a morning CoOp. Our experience has shown that employers have a need at this time also.

13. Avoid having group with distinctly different goals in the same class; such as the hospital and nursery girls unless both groups are to have the same lab experience. The lab experience is a "must" for the optimum development of the students.

14. Plan six to eight weeks for orientation before nursery opens allowing an opportunity for many, many field trips to be planned. Devote some class session before school opens to (1) "role playing" (this accquaints students with behavior they might expect exhibited by children and their parents, also some of their own reactions to the same. (2) Make articles for the nursery school such as puppets, housekeeping items (they are fun, they are needed, they get the students interested and in a state of anticipation).

15. Daily oral evaluations of nursery program by class as a group. Frequent observations of nursery children written objectively and predictions of child's future growth patterns.

16. Have related class meetings regularly. Once a week minimum.

17. If in doubt over advisability of continuing a student on a training station which you suspect is violating their license to operate or violating legal employment practices, do not hesitate to investigate the matter quickly and thoroughly and seek advice of the Director of Vocational Education, the Principal, even the Superintendent if it seems warranted. (One student covered up her employer's violations, when they were discovered, they were serious enough that the high school coordinator felt they should be reported to the licensing agency. Realizing the consequences of such an act, she consulted the Superintendent who gave wise counsel as to how to handle the matter).

18. Parent-student (perhaps employers also) meeting in Fall of year to discuss program.

19. Accept as many invitations to speak on your program as you possibly can. Good public relations help expand your program.

44

20. Do not accept a student teacher from a University during the first year of operation, unless this person has had considerable nursery school experience. It is not fair to either the college student, the high school student or the children in the nursery.

21. The flexibility of the schedule is often times interpreted by the other personnel in the building as freedom from class assignments. They are not in the building when you return to the building at 5 p.m. after a conference with an employer!

22. Be prepared for conflicts with fellow teachers and counselors as they are inevitalbe. Do not be discouraged for as you apply your knowledge of human development and try to be understanding of the other fellow's problem--it will work out. Give your enthusiastic support to your fellow coordinators and your Vocational Director at the high school.
Participate in CoOp Banquet. (Your employers really enjoy this!)
Join Local and State Coordinators Organizations.

23. An assistant is most desirable. Someone to take over the nursery when necessary, but even more valuable for the clerical work required if one is doing a good job. Some teachers might prefer to turn the nursery program over to a nursery school teacher and work only with the high school students. Pros and cons both ways. Coordinating might sound difficult, but it adds "spice" and "diversity" to the job. It is fun, it's stimulating, and the employers appreciate the coordinator as a person very knowledgable of the requirements in their particular endeavor. The principal of the high school should be very much interested and enthusiastic about the class to give you support when you hit low periods.

24. Be prepared to have a wonderful, exhilerating, and rewarding year. The Vocational Education "kids" (really young adults) love what they are doing! They admire their instructor and some even "love" you! They do nice things for you and their classmates. THEY ARE JUST PLAIN WONDERFUL!!

RECOMMENDATIONS FOR OPERATING A NURSERY SCHOOL LAB

1. Allow ample time for parent-child interviews and student conferences. (This takes far more time than one realizes).

2. Attendance at professional meetings and workshops for Pre-School Educators and also the Cooperative Nursery School Council Workshops are very important. (Make a real effort to do this and always take a car load of students along. Make attendance of some of these required).

3. The instructor should plan and direct the Nursery School Program in the beginning gradually allowing students to assume more and more responsibility as time goes on.

4. Appoint a student "in charge" of the total program for specified length of time. (Obviously when they become well enough prepared to do so). This student should be capable of running the Nursery when a substitute teacher arrives in the event of the instructor's absence. Hopefully your program will include some girls of this caliber.

5. Prepare a list of qualified substitutes before you open the nursery. Know them personally.

6. Cancel the Nursery program when you must be absent and you can not secure a substitute from your list.

7. Do include male students in this program. Many employers have requested this, although we do not have any at this time.

8. Availability of transportation to CoOp jobs should be verified in advance. Give parent an opportunity to participate in some way. Conferences, carpools, help to plan parent meetings, help with field trips, and evaluation of the program.

9. Explore the high school building through the eyes of the young children. (This is a real eye opener for your high school students as well).

"Here's the woodshop where Scott's daddy works."...When taking a wagon for repair, "Let's see if the auto mechanics boys can fix the broken axle on the wagon."..."Let's tip toe into the auditorium and sit quitely while we listen to the orchestra practice. Do you see Annette's sister playing the violin?"..."This is where Miss Sandy comes after you go home for lunch. Would you like to type your name on this sheet of paper?"..."How many fish do you think are in this aquarium?"..."... and this is where the high school students eat their lunch."..."Curious George would love to be in our tropical jungle." (The green house)..."Linda and Nancy come here for their swimming lessons, but this is where we come when we are having a tornado drill."...(We also visited the print shop, bookstore, library, receiving dock, and watched high school band practice.

YOU DON'T HAVE TO LEAVE THE BUILDING FOR A YEARFUL OF FIELD TRIPS, ALTHOUGH YOU MAY OF COURSE!

Limit number of students in the nursery laboratory to eight at any one time (two to each area maximum), unless observation booths are available. High school youth like to be WITH the children, not just observing them.

Arrange with Principal "visiting days", and try to avoid more than two visitors on any one day. Visitors tend to over-stimulate the children, keep visitors in the background.

Parent Pot-Luck toward end of year for Nursery school parents and students for evaluations and fun!

Newsletter for parents, written by students.

Gentlemen

In November of 1965, with permission of Mr. Houghton and Mr. McGregor, I attended the Home Economics State Conference in Grand Rapids. The emphasis was on teaching Home Economics for Wage Earning. The possibilities are numerous, and are limited only by the facilities we have available! The conference left me with an enthusiasm that has not diminished with time. I believe we can embrace at least one of the programs suggested at this time, with facilities all ready provided in our lovely building. This program would be in the area of Childcare Training.

Since the Vocational Education Act became a law in 1963, home economics education has taken on a dual role. It has always had as its purpose, preparation for the vocation of homemaking. Now there is an added objective. This is not intended to replace the original goal, but to add another purpose. That is to prepare people for gainful occupations which use home economics knowledge and skills. The two programs will fit side by side and one will help the other. The success of these two programs depends upon the degree to which they are separated.

Home Economics Education to prepare youth and adults for employment has become a reality as a result of the passage of the Vocational Education Act of 1963. For the first time in its history home economics education has an additional emphasis to that of educating for homemaking.

Programs may be developed for training in occupations involving the subject matter fields of child development, clothing, textiles, food and nutrition, institutional and home management, interior decorating, furnishings and equipment. Employment opportunities are greatest in occupations which provide services to families in the home or to persons in the community as in institutions or similar group situations.

This kind of help is needed by many people, not only because of social or health diagnosis but also because of demands in carrying on a normal family life in a culture in which employment of women is an accepted ingredient. It is needed in homes at all income levels, both urban and rural, where children need care that parents cannot give and where aged and disabled persons need care that is difficult to obtain.

This broadening of homemaker services will not only serve families in need of such assistance; it will create part-time or full-time employment for women with low incomes and encourage better use of trained professional womanpower.

The same basic knowledge and skills are the foundations for both types of Home Economic Programs. With different information, methods, goals, and experiences, the curriculum becomes effective instruction for those preparing for homemaking or for those training for gainful employment in occupations using the knowledge and skills of Home Economics.

Preparing people for employment is a more specialized type of program than for homemaking. It is necessary to narrow the learnings taught and to be very specific in those skills considered important to successful employment. Instruction needs to be sufficiently broad but at the same time intensive enough to prepare students for satisfying and continuing employment.

Teachers selected to teach these courses should have the following qualifications:

1. Background experience with occupations other than teaching
2. Awareness of employment needs of the community
3. Understanding of workers and the working conditions and problems between them
4. Ability to establish contact and good working relations with employers.

Many variations will be found in the programs for gainful employment as they are developed. The needs, interests, and abilities of the persons to be trained will affect the program of instruction as well as the need for services to homes and families. So far, materials have been developed for nine home or community service occupations. A suggested procedure for the area of child care has been developed and we would like to use this as our guide. I am also planning on participating in a workshop at Wayne this summer in this particular area.

A small scale employment survey in this area, conducted by myself revealed a definite need for the type of program we are able to offer. Checking over the programs offered by the MDTA in this area, I find none listed. An interview with Mr. Luther Olson, of the MESC (Royal Oak office) revealed a great need for Domestic workers, which they are unable to fill. I do not like to think of the proposed program as "Domestic"...even though it might fall somewhat in that category. The ABC Nursery Agency tells me that it is impossible to find anyone willing to work during the dinner hour. The daily newspapers carry ads which indicate a great need. Last summer, the Headstart Program, deplored the lack of trained people in the area of Childcare. This was true in Oakland County, as well as elsewhere. The students themselves, when approached on the subject, are most enthused and hopeful that we might have such a course. At the present time, I'd guess that 25% of my students are engaged in after school jobs, requiring them to care for children and prepare the evening dinner meal, for families other than their own. Another 25% are presently carrying for the younger children in their own families and preparing the evening meal. Summer employment involving girls assuming the responsibilities for mothers who must be absent from their home, is definitely available.

Mrs. Betty Malos of the UCS of Metropolitan Detroit, has suggested some aids we might use, and again feels there is a real need for this type of program, and that perhaps adults should be receiving this as well.

Early marriages, more women working, more specialized occupations, mean that jobs for the unskilled are becoming less and less available. There will be a great need for more service occupations, as many women return to the field of work.

In the 1970's it is predicted that almost one half of the labor force will be women, and assuming or combining two roles--homemaking and wage-earning. Most will have children and a need for a stable home(for consolation in time of trouble, and stimulation at all time for their best growth and development). Those with young children and adolescents will find this very difficult. Preparation for this dual role is obvious. Employment opportunities are greatestin occupations which provide services to families in the home, etc.

These are only a few of the reasons why home economics educators are concerned about preparing women and girls for gainful employment.

Factors to be considered in setting up a program...

1. Is there a need for this type of service in the community?
2. An advisory committee should be set up, to include:
   a. representative from school guidance staff
   b. local employment office
   c. potential employers
   d. informed, imaginative and dedicated people who can truly represent the community...

   (this committee to work with the home economics staff to study the need of group to be served, and the resources available for the training program.)

Programs must be designed to:

1. Develop skills (manipulative, managerial, and relationship)
2. Attitudes essential for securing employment
3. Successful performance of work required for the occupation

Trained job analysts from the Employment Office, in addition to our people in the Trade and Industrial field might help in setting up the plans for training and selecting essential learning experiences.

The job analysis will not only determine the content and the learning experiences required for helping trainees become good workers, but will also be the means of making a reasonable estimate of the time needed for the training program.

It will be necessary to provide time in a teacher's schedule for investigation of needs, contact with employers, development of curricular and instructional materials, counseling of pupils and supervision of the work experience program.

Penta County Vocational School in Perrysberg, Ohio has an excellent program in Childcare. It has been suggested by Mrs. Thelma Graper (Family Life Division of State Board of Education) that I visit and look into their program. This school is located just south of Toledo. Hazel Park High School has a similar program in progress, and I would also like to visit there. I have talked by phone with the principal, Mr. Newberry, who is most enthusiastic about the program.

In addition to the equipment needed (separate list), I should like to use four textbooks. It is difficult to limit one's self to one. Each book has so much to offer. With eight copies of each text (less if necessary), we could cover all areas well. I've listed them in the sequence that I would choose them in, if limited.

$4.-- 1. The Nursery School by Katherine H. Read.... W. B. Saunders Co.
Charles A. Bennett Co.

$4.95 2. The Developing Child by Holly Brisbane (Same given me by David Cuff, 103 S. Lewis, Saline, Michigan)

$3.66 3. Family Nursing and Child Care by C. Luise Riehl, R. N., (Same source as above)

$2.40 4. The World of Children By Marcella H. Ellett...Burgess Publishing Co.

The last two would be particularly aimed at the needs of the slower learners in the class... and also would be used , especially the last named, for Homemaking classes, in units on Childcare.

I envision the laboratory being used to train for wage earning, and yet available for observation of childcare and human development for other classes, not only in our department, but also in the biology and social studies departments. The one way observation glass, makes this arrangement very possible.

I believe that we can accommodate eight students per section, and should be able to handle two sections a week. The students would be in the nursery school lab for two mornings a week, and at a training station 2 or 3 mornings. The fifth morning would be spent in contacts with either students or employers etc.

Possible Training Stations

Providence Hospital
Beaumont Hospital
New Grace — Pediatrics Ward
Ardmore
Sinai

Nursery Schools, Blue Bird, Drayton Ave. CoOp, Gateway Nursery, Huntington Woods Nursery School, Jack & Jill, Pleasant Ridge CoOp, Paul Best CoOp

Ferndale has several excellent programs in job training, I feel this would be a valuable addition. I have all the materials necessary to set up the program, and also the qualifications for the position as teacher as outlined previously, including experience in the Wayne State University Home Economics Laboratory Nursery School.

VOCATIONAL TRAINING PROGRAM
FOR
CHILDCARE AIDES

Ferndale High School Home Economics Department

I Orientation to Employment as A Child Care Aide

A. Importance of Occupation
B. Responsibilities assumed by a person so employed (including health standards)
C. Desirable personal characteristics (qualities employers seek)
D. Health and Grooming
E. Getting that job
F. Agreements between employer, school & aide
G. Getting acquainted with the children and the job situation
H. Types of positions available - skills required for each
   a. group day care centers
   b. hospitals
   c. institutional agencies providing homes for children
   d. in the home
   e. differences and similarities in jobs in homes and centers
   f. advantages and disadvantages of each type work
   g. other occupations involving work with children

II Orientation to the Child Day Care Center and Nursery School Laboratory

A. Physical plant
B. Organization
C. Brief introducation of characteristics and needs of young children and their mothers
D. Health and sanitation in the Day Care Center
E. Nursery School routine
G. Food handling and first aid in our school laboratory
H. Learning thru observation of the child's play

I. Play activities
J. Discipline
K. Behavior
L. Field trips, films and speakers on above areas..

a. Merrill Palmer Institute
b. Wayne University Laboratory Nursery Schools (HOME EC & ED DEPT.)
c. Brewster Douglas Day Care Center (CIVIL SERVICE)
d. Lafayette Clinic
e. Franklin Settlement House
f. St. Vincent, Sarah Fisher Home for Children
g. Methodist Children's Village

III Envirnoment and Heredity

IV Pregnancy and Prenatal Development

V Childbirth

VI Health & Emergencies & Safety

A. Emergencies
B. First Aid
C. Prevention of illness
D. Caring for the ill child
E. The patient's room
F. Nutrition
G. Childhood Disease

VIII Looking Toward Adulthood

A. Children and You
B. Values of good parenthood
C. Yesterday, today, and tomorrow

IX Summary and Evaluation

A. Overview and application of learnings
B. Employment procedures

BACKGROUND EXPERIENCES HELPING ME TO DO THE TASK...

I INSTRUCTOR -- B.S. Degree in Education, Secondary and Vocational Certificates...

II DIRECTOR -- Very definitely previous work experience in nursery school prepared me for this role.

A. Berkley Area Nursery ...Service on Administrative Board (voluntary) 1953-1958
Paid salary as Assistant Teacher..taught for one semester (pregnancy forced retirement)

Experience gained:

1. Work with children in all areas of the program
2. Selection and purchase of equipment
3. Interviewed and hired teachers
4. Financial responsibilities of the school
5. Familiarizing self with licensing and other requirements of a good nursery school program
6. Planning and conducting parent meetings
7. Administrative Board Meetings and preparation of brief report for Berkley P.T.A. Council
8. EXPOSURE TO OTHERS IN NURSERY SCHOOL FIELD

B. Wayne State University Nursery School (Home Ec. Laboratory)
Paid salary as an Assistant Teacher (classified at WSU in pay schedule as a Laboratory Technician)

Experience gained:
1. Some of the above
2. Involvement in:
   a. individual interviews with prospective children and their mothers
   b. parent conferences
   c. planning and coordinating various aspects of the program delegating as much responsibility as possible to college students (College of Nursing, Education & Liberal Arts)
   d. parent meetings (of educational value)

III SUPERVISOR

A. Experiences at WSU Lab Nursery also include:

1. Supervision of college students and guiding them in the area under my jurisdiction.
2. Helping college students find their own strengths and weaknesses.
3. Evaluating student's work on a team composed of:
   a. Dr. Esther Callard-Supervisor
   b. Mrs. Luella Lutz-Director
   c. Mrs. Eileen Hartley -Co-assistant
4. Complete responsibility for part of program assigned me by the Director.

IV VOCATIONAL COORDINATOR

A. Contacts made thru the two above experiences opened many doors to me as I sought training stations. I knew what I was after and was able to make my point and sell them on the program. Earlier experiences helped me to see the problems and how to manage them. At this point I would discourage anyone without at least two years work experience in nursery schools and considerable study in the area of child growth and development.

V ADDITIONAL BACKGROUND AND ADDED EXPERIENCES OF GREAT HELP:

A. Graduate school-Wayne State University
B. Major in Human Development thru the Home Economics Department.

JOB DESCRIPTION OF INSTRUCTOR IN VOCATIONAL CHILDCARE AIDE PROGRAM

I INSTRUCTOR
- A. Homemaking IV
- B. Vocational Homemaking IV

II DIRECTOR OF THE LABORATORY NURSERY SCHOOL* involving:
- A. Individual interviews of prospective children and their mothers
- B. Conferences with parents throughout the year
- C. Selection of equipment and shopping for same
- D. Developing, planning, and coordination of the program
  - 1. delegating as much responsibility as possible to the high school students
- E. Supervision of the high school students on the program
- F. Developing good attitudes toward nutrition and hygiene in the program
- G. Meeting licensing requirements
- H. Planning and implementing parent meetings
- I. Interpretation of the Nursery School to parents, students, visitors, etc.

III SUPERVISOR - of the high school students
- A. Includes D, E, F above
- B. Guiding students in understanding the needs of children and their developmental processes
- C. Helping students to find their good points and those that need improvement
- D. Encouraging participation by student in all the Professional Meetings and Workshops for people in the field . . . my students have attended many, many outside functions this year on their own time and their own expense to improve themselves in this line of work. . including Cooperative Nursery School Workshops, Preschool Association of Metropolitan Detroit Workshops and meetings, plus private workshops in art, music and story telling.

IV VOCATIONAL COORDINATOR
- A. Locate training stations (minor in Distributive Ed. helped me on this one also!)
- B. Vocational Counseling
- C. Matching students and employers
- D. Evaluation of students on the job
- E. Luncheon for employers
- F. Participation in MOCA (Macomb-Oakland Coordinators Association)

G. Meetings and conferences with other Coordinators at Ferndale High School
H. CoOp banquet participation
I. Placement for summer and permanent positions

V. HOSTESS - Couldn't resist adding this one.. it has been the "bonus"... it has been fun and educational for both myself and the girls, as our visitors have come from far and near...

Form No. V.E. C24
Leland Vocational Education Conference
June, 1967

COORDINATORS' PITFALLS

1. Accepting students for "co-op" who have not had their present or prospective jobs evaluated.

2. Accepting students for "co-op" without adequate counseling.

3. Not knowing the prospective employer or job.

4. Not properly informing the employer of the total program.

   a. Not giving the employer an opportunity to help develop the written program.

   b. Not giving the employer an opportunity to participate with the instruction.

5. Not having a well organized and instructive related study program. (Related class should meet a minimum of 5 hours weekly.)

6. Not keeping all teachers informed as to the progress.

7. Not regularly giving the school administration a written progress report.

8. Not giving teachers an opportunity to participate - (selection, follow-up, and instruction).

9. Not visiting "co-op" work stations periodically. (Should visit every 4 to 6 weeks with variations).

10. Not contacting parents before starting their son or daughter on "co-op". (Possibly a parent, employer meeting in the Fall).

11. Not having an adequate selection process.

STUDENTS ENROLLED IN VOCATIONAL CHILDCARE
TRAINING PROGRAM 1966-67

I <u>Daycare Center</u>

A. Gateway

1. Sue Aubuchon (Roeper's Country Day School Fall of '67)*
2. Linda Gumro (Ferndale Recreation Dept. Summer Program "Storyteller")* (Roeper's Country Day School Fall of '67)*

B. Cherub Haven

1. Helen Norleen (Cherub Haven-summer '67)* (Must choose between Cherub Haven and Roeper's Country Day-Fall of '67)*
2. Mary Wilhite (U.S. Army-W.A.C.)*

II <u>Nursery Programs</u>

A. Huntington Woods

1. Suzy Chambers (Huntington Woods Nursery Summer of '67)* (Highland Park Junior College-Fall of '67 to prepare for Nursery School Education.)*
2. Kathy Young (Huntington Woods Nursery-Summer of '67)* (Huntington Woods Day Care Center-Fall of '67)*

B. Drayton Avenue Cooperative Nursery

1. Patricia Berndt (Helping her mother this summer--by assuming home-makers role while mother works.)* (Roeper's Country Day School Fall of '67)* (Oakland University--Nursery School Education, part-time student-Fall of '67)*

2. Betty Littlejjohn (Childcare in private home--Summer of '67)*
(Bible College or Beauty School--Fall '67)*

C. YWCA Ladies Day Out Nursery

1. Sue Weigandt (Left to enter Providence Hospital Training Program-Nov. '66--permanent position at Providence upon graduation June '67)*

III Child Development Center (Headstart)

A. Grant School

1. Johnnie Collins (Grant School--Summer of '67 and Fall '67)*

IV Health Centers

A. Providence Hospital

1. Doris Allgood (continuing--Summer '67)*
(Medical Technician School Fall of '67)*
2. Brenda Bozied (continuing--Summer '67)*
(Entering Macomb Community College for Associate Nursing Diploma--Fall '67)*
3. Renata Contesti (continuing--Summer '67)*
(Entering Providence School of Registered Nursing--Fall of '67)*
4. Linda Fair (continuing on permanent basis)*
5. Brenda McClelland (continuing--Summer '67)*
(Entering Shapero School for Practical Nursing--Fall of'67)*
6. Sue Weigant (continuing on permanent basis)*

B. Oakland County Health Dept.-Well child conference

1. Brenda McClelland (Left to enter Providence
2. Brenda Bozied Hospital Training Program in November '66)*

V Laboratory Nursery

A. Ferndale High School Home Ec Dept.

1. Lois Patton (Grant School--Summer '67)*
(possibly Roepers Country Day School--Fall of '67)*

2. *Sandy Bird (Huntington Woods Nursery in Fall of '67 as clerk-typist--filling in when needed as childcare aide-having received training in both areas.)*

* Sandy in addition to participation in Nursery School in the mornings worked as student assistant fifth period daily in the Nursery School assuming necessary clerical & typing responsibilities..Sandy received Honarary Award upon graduation for outstanding typing achievement.

* Information within parentheses refers to placement upon completion of the training program.

Criteria for Selection
of
Children for Ferndale High School
Home Economics Laboratory Nursery School

1. Must be three years old by December 1st, 1966 and inelgible for 1966 kdg program.
2. Six boys - ages distributed broadly from 3 thru 5.
3. Six girls - ages distributed broadly from 3 thru 5.
4. Must enroll for five day week program.
5. Must furnish own transportation and delivery into the building, and exit from same.
6. Preference will be given to children enrolling for entire school year. No one will be accepted for less than one semester.
7. Tuition of $43.30 per year must be paid by personal check or money order and is due in two installments. First one due on September 25th, second one January 25. If this creates a hardship, we may be able to make some allowances.
8. Refunds will be given ONLY upon written request, and on a percentage basis. After eight weeks of semester have passed, no refund will be made for balance of that semester.
9. Some parental participation will be expected upon request. This might include transportation for a field trip, telephone calls in case of an emergency, a few meetings for parents during the school year.

Preference will be given to children living within the district, but we shall be happy to put other children's names on our waiting list, should we be unable to fill our quota (12 children) from our school district.

JOB ACTIVITIES RELATED INSTRUCTION

The above trainee's program and conditions of employment are satisfactory to Ferndale High School and _____ _____, each of whom assumes responsibility for training under the following conditions:

1. Training begins on _____ and terminates on _____ or upon agreement of all parties involved.

2. The trainee shall diligently and faithfully perform the work duties of the job and abide by the plan of training as outlined above.

3. The employer agrees to provide bona fide training in the occupation and according to the terms stated above.

4. The trainee is subject to the rules and policies of the employer and may be transferred or dismissed when violations occur.

5. This training program agreed upon shall not be interrupted by either trainee or employer without consultation with the coordinator.

6. The employment of the trainee shall conform to all federal, state, and local laws and regulations.

APPROVED:

Employer	Date	Parent or Guardian	Date
Trainee	Date	Coordinator	Date

NOTE: The purpose of this training agreement is a memorandum for all parties concerned and is not to be considered a binding legal contract in any way.

JOB DESCRIPTION
(as given by employers)

I Daycare Centers:

A. Qualities sought in Childcare Aides

1. Loves children
2. Patience (don't threaten unless you follow through)
3. Be firm! Or kids take advantage (interpreted by class.. as "setting & maintaining limits")
4. Don't amuse them! Let them discover things on their own.
5. Don't be "too" sympathetic.
6. Happy countenance--to attract Children.
7. Alert-quick-eyes in back of head!!
8. Open-minded, not afraid to ask questions.
9. Being willing to accept responsibility.
10. Have Iniative.
11. Neatness & cleanliness (well groomed).
12. Warm personality.
13. Ready smile.
14. Interested in children--child development background desirable.

B. Skills

1. Selection of stories and songs, appropriate for a given age group.
2. Knowledge of various "story telling" techniques and acquaintance with
   a. reading technique
   b. "telling" a story
   c. finger play
   d. puppetry
   e. felt board
   f. chalk board
3. Lead singing time.
4. Make playdough, paints, etc.
5. Musical instrument ability good.
6. Science knowledge would be nice.

Suggestion: Have "aides" work in areas they feel most confident in. Let them do what they do best! Specialization is good in this area of employment.

II Childcare Institution

A. Qualities
   1. (See list for Daycare Center -- appeared the same.)

B. Skills

   1. Help kids get dressed.
   2. Supervise nursery.
   3. Help with baths.
   4. Bed making.
   5. Dishes!
   6. Children's meal preparations.

Responsibilities in Assigned Areas

I PAINT AREA

1. SET UP PAINTS AND/OR WATER PLAY. Remember to spread newspaper under easels and on tables when used for these purposes.

2. SET UP DOUGH TABLE (not necessary every day)

3. PLAN ON SOME SPECIAL ACTIVITY in this area every day - for instance, "sponge pain ting," or "blowing bubbles", "spatter paint", etc, be creative do not use the same thing every day. Look for new ideas in reading materials provided and workshops attended.

4. KEEP AN EYE ON SUPPLIES - turn in a shopping list to me for anticipated needs. . . (Paint running low? Which color, etc.)

5. CLEANUP INVOLVES COMPLETE CLEANING OF AREA, everything stored in proper place in cupboard and aprons tied to easel or on hooks (not thrown over boxes, counters, or on floor).

6. PAINT TRAYS ON EASELS TO BE SCRUBBED THROUGHLY, and tops screwed tightly on paints. Brushes washed (by children perhaps) tips shaped and left to dry.

II BLOCK & GYM AND/OR OUTDOOR AREA

1. SET UP SOME INVITING PLAY. . . . perhaps planks across two blocks, or a road for trucks or the beginning of a building etc.

2. CLIMBING GYM AND SLIDE arranged so as not to enter with traffic pattern of nursery school.

3. IF ROPES ARE USED, check the knots and condition of ropes frequently.

4. STORY FOR FOUR YEAR OLDS, take turns with the story for instance:

   1st and 3rd weeks-Girls in charge
   2nd and 4th weeks-Helper

III FAMILY LIVING AREA (QUIET ACTIVITIES)

1. SET UP INTERESTING DISPLAY OF BOOKS OR PUZZLES.
2. SCIENCE INTEREST
3. Other quiet activity.
4. Phonograph
5. Housekeeping, dramatic play (hospital, doctor, etc.)
6. Help greet children at the door in the morning.
7. STORY TIME
   1st and 3rd weeks-Girl in charge
   2nd and 4th weeks-Helper

IV KITCHEN AREA (SNACK TIME)

1. Plan menu's a week ahead.
2. PLAN GROCERY LIST a week in advance
3. SHOP FOR GROCERIES (see Mrs. Connell for money)
4. SNACK READY BY 9:45, involve the children, sit at the table with them in a small chair.
   Girl in charge 1st and 3rd weeks
   Helper in charge 2nd and 4th weeks
5. GOOD HYGIENE AND SAFETY HABITS. Dispose of all cups, napkins and paper plates each day. Only use metal pitchers when absolutely necessary. Scrub all work surfaces and tables thoroughly before and after food preparation and serving.

Snack should ALWAYS include three food groups:

1. Fruit or Vegetable
2. Cereal (includes crackers, breads, dry cereals, etc.
3. Milk (available thru cafeteria at 2¢ per carton, and also cheese is good).

Spiritual care
- Communion, preparation of the patient for
- Sacrament of the sick, preparation of the patient for

Straining urine
Team Nursing, participation in
Temperature, pulse, respirations
- Temperature (oral, rectal, axillary)
- Recording of

Weighing patients

RESPONSIBILITIES WHILE ASSIGNED TO PEDIATRICS

1. orientation to care of the sick child
2. physical and emotional care of pre-school child
3. physical and emotional care of school age child
4. physical and emotional care of adolescent
5. feeding the infant
6. feeding the pre-schooler (assisting)
7. morning care
   a. bathing - complete and partial care
   b. brushing teeth
   c. combing hair
   d. making beds
      1. crib bed
      2. adult bed

ROUTINE NURSING CARE

1. bathing babies - dressing - making crib beds
2. weighing
3. taking temperatures
4. assisting a physical examination
5. feeding - holding - burping babies
6. taking babies to mother assisting them in feeding their baby, checking identification of baby and mother's wrist band
7. changing diapers
8. observations of newborns - charting
9. Hand washing - technique & gowning

MEETING EMOTIONAL CARE

1. safety factors
   a. safety pin
   b. side rails
   c. crib net restraints
   d. safe handling of infants
   e. safe handling of toddlers
   f. keeping dangerous objects out of reach
   g. careful handwashing
2. observation of:
   a. pre-schooler
   b. infant
   c. toddler
   d. school age
   e. adolescent
3. taking children to various departments for examinations - isotope
4. Play therapy - procedures
5. Oxygen therapy - crup ette - urine collectors

EVALUATION OF CHILDCARE AIDE

By Supervising Teacher _____
name

Training Station _____ Hours _____

In order to help us improve our program, we would like to have you give us you frank opinion of the student assigned to your station. Anything you have to share will be strictly confidential and will be kept in my personal file on each student.

	YES	NO	NOT SURE
1. Did she have a personality that appealed to you? (Did you like her as a person?)	___	___	_____
2. Was she pleasant at all times?	___	___	_____
3. Was she interested in her work?	___	___	_____
4. Did she take suggestions well?	___	___	_____
5. Did she keep the facilities in order?	___	___	_____
6. Did she practice good health and sanitation habits?	___	___	_____
7. Did she help prepare food?	___	___	_____
Did she help serve it?	___	___	_____
Did she function well in this capacity?	___	___	_____
8. Did she get along well with children?	___	___	_____
a. sensitive to needs of the individual child?	___	___	_____
b. Flexible in her handling of children?	___	___	_____
c. alert and quick to respond to emergencies?	___	___	_____
d. handle her feelings well when unpleasant or frustrating tasks were given her?	___	___	_____

	YES.	NO	NOTSURE
e. appear confident?	___	___	_____
F. help build confidence in children by her handling?	___	___	_____
g. did hostility in children upset her?	___	___	_____
h. Did she handle these situations well?	___	___	_____
i. did aggressive children appear to alarm her?	___	___	_____
j. was she able to maintain "limits?"	___	___	_____
k. did she contribute many of her own ideas?	___	___	_____
9. Did she go ahead with her work or wait to be told what to do?	___	___	_____
10. Did she get along well with other members of the staff?	___	___	_____

11. Would you say the skills acquired in the school classroom were:

Excellent ____ Good ____ Poor ____ Unsatisfactory___

12. Which additional skills would you suggest would be of further help?

_____

_____

_____

13. In which area of the nursery did this student appear most competent? _____

_____

_____

14. Which area was the most difficult for her to manage?

_____ _____

_____

Would you recommend her for employment as a childcare aide in the following positions?

	YES	NO	MAYBE
1. Day care center	___	___	___
2. Childcare Institution St. Vincent, Sarah Fisher Home for Children Methodist Children's Village	___	___	___
3. Child Development Center (year around nursery school for underprivileged)	___	___	___
4. Kindergarten Teacher's Aide	___	___	___
5. Pediatric Ward of Hospital	___	___	___
6. Private home			
a. limit to short hours only	___	___	___
b. Complete charge of children of working mothers, or motherless home	___	___	___

Any other comments you have on this student, or you own feelings about our program would be most appreicated. We can improve only if we know what our shortcomings are...

Name _____ Date assigned _____

Training Firm _____ Date Due _____

"KNOW THYSELF"

To the trainee: As a student-learner you want to know "what's par for the course" and whether you are measuring up to the expectations of your employer. Not everyone is willing to admit it, but everyone wants to know how he is doing. Completion of this rating sheet will be assigned when your teacher decides on the rating period. Your teacher may want you to rate yourself or may ask your training station supervisor to do it. In either case, study the rating sheet carefully because it covers the essentials expected of every worker. Check carefully also the five subpoints under each category -- remember you can be strong overall but still need improvement in one or more phases of your development. You can use this rating sheet also as a guide to improving yourself from week to week.

<u>Directions to the person doing the rating -- the trainee or his superior</u>:

1. Note that each rating is defined in terms of several traits or characteristics that the trainee should exhibit.

2. Rate each trait in accordance with the standards that regular employees must meet.

3. Give an overall rating in each area by circling the word which best describes the employee's performance: Example - "Average". Then indicate the number of any particular subpoint in which the trainee needs improvement:
   Example: 1 <u>2</u> 3 4 <u>5</u>

.....

A. PUNCTUALITY ... to mean: (1) arriving at work on time, (2) completing work by the deadline, (3) returning from breaks and lunch on time, (4) arranging for lateness or time off in advance, and (5) giving the impression of alertness and "being all there."

.....

Superior Above Average Below Average Poor
Needs help in: 1 2 3 4 5

.....

B. HUMAN RELATIONS ... to mean: (1) cooperates with supervisors and accepts suggestions, (2) courteous and friendly manner, but not "too friendly," (3) controls his emotions for the best interest of all, (4) does not cause dissensions, and (5) responds to the best in others.

.....

Superior Above Average Below Average Poor
Needs help in: 1 2 3 4 5

.....

C. ATTITUDES TOWARD WORK ... to mean: (1) looks for ways to improve, (2) is a real "hustler," (3) does not have to be told what to do next, (4) is inquisitive, and (5) is enthusiastic, not cool about his work.

.....

Superior Above Average Below Average Poor
Needs help in: 1 2 3 4 5

.....

D. PERSONAL APPEARANCE ... to mean: (1) dresses according to the rules, (2) grooming is above reproach, (3) never gives the impression he needs more sleep, (4) speaks well and shows good choice of words, and (5) presents a businesslike appearance.

.....

Superior Above average Below Average Poor
Needs help in: 1 2 3 4 5

.....

E. WORKMANSHIP ... to mean: (1) budgets his time carefully, (2) shows thoroughness in his work, (3) feels that even routine jobs are important, (4) is accurate and careful, giving attention to details, and (5) gets the job done in a minimum amount of time.

.....

Superior Above Average Below Average Poor
Needs help in: 1 2 3 4 5

.....

F. IMPROVEMENT IN SKILL ... to mean: (1) is able to think for himself without excessive supervision, (2) does not have the attitude that he is perfect, (3) recognizes the value of the training opportunity offered him, (4) has gained satisfactory speed and accuracy on the job, and (5) has achieved businesslike habits.

.....

Superior Above Average Below Average Poor
Needs help in: 1 2 3 4 5
.....

If this student were available for full-time employment, would you on the basis of your experience with him: (check one)

____ 1. Try by all means to hire him?

____ 2. Hire him if he applied?

____ 3. Employ him if no one else were available?

____ 4. Refuse to employ him in the firm?

General comments concerning bright spots or deficiencies: _____

Firm name _____

Name of Rater _____

Date of Rating _____

Helen M. Murphy R.N.
Service Instructor

Midterm Evaluation
Providence Hospital
Nurse Aide Evaluation

Name: Brenda McClelland

Date of Employment: 10-31-66
Date of Evaluation: 12-22-66

APPEARANCE:

	Good	Average	Poor
a. Uniform		X	
b. Shoes	X		
c. Hair		X	
d. Personal Hygiene	X		

COMMENTS: Always clean and neat.

COMPETENCY OF PROCEDURES:

a. Knowledge of Principles	X		
b. Ability to carry out procedures			
1. Speed		X	
2. Considers the safety, economy, comfort of patient	X		
3. Organization of work		X	

COMMENTS: Good correlation of theory and practice. Usually knows the reasons for what she is doing. Carries out procedures as taught. Vision is poor, but this has not interfered with her work. Very conscientious of the safety and comfort of her patients. Improving in the planning of her work, but still needs to concentrate her efforts in this area.

ABILITY TO WORK WITH OTHERS:

	Good	Average	Poor
a. Attitude toward correction	~~X~~	~~X~~	
b. Attitude toward helping others	X		

COMMENTS: Very receptive - listens carefully to what she is being told. Eager to learn. Rarely have to repeat the same thing twice. Very willing to help others, but still pretty much involved with her own work.

INITATIVE AND RESPONSIBILITY:

a. Reports to Team Leader		X	
1. On and off duty		X	
2. Symptoms and changes in pt's condition		X	
3. Errors			
4. Accidents			
5. Unfinished assignment		X	
b. Responsibility to Patient			
1. Recognizes physical need of patients and the care of them and report to T.L.	X	X	
c. Responsibility to Self			
1. Has self-confidence		X	X
2. Completes assignments	X	X	
3. Asks when in doubt	X	X	
4. Usually is punctual		X	

COMMENTS: Improving here. A little less afraid and shy. Needs to speak louder to patients and personnel. Reports to team leader are more pertinent. Gives thorough basic nursing care.

COMMENTS: Becoming more aware of her patients physical needs and many of the more obvious emotional needs. Still a little ill at ease with team leaders. Hesitates asking her team leaders to repeat something she doesn't understand. Still lacks self-confidence but I feel with more experience will continue to improve in this area. Can be trusted to ask when in doubt!

PROFESSIONAL FITNESS:

	Good	Average	Poor
a. Approach to patient	X		
b. Poise		X	
c. Deportment on duty	X		

COMMENTS: Very sincere and interested in her patients as individuals. Goes out of her way to make them more comfortable. Is able to determine the atmosphere of the sick room, and act accordingly.

Providence Hospital
16001 Nine Mile Road
Southfield, Michigan
Telephone 353-3000

June 27, 1967

Theda T. Connell, Vocational Coordinator
Home Economics Department
Ferndale High School
881 Pinecrest
Ferndale, Michigan 48220

Dear Mrs. Connell:

I am sorry I did not answer your request sooner for an evaluation of our cooperative venture in Ferndale High School CoOp Program.

It was a very interesting and challenging experience working with the students from Ferndale High. They had many problems becoming adjusted to the hospital setting. Unfortunately in the group were two pregnant girls,* but the rest of the students were interested teenagers.

Because your program was geared to a Child Care Aide, the students worked only in Pediatrics and Nursery. This concept of a CoOp Nurse Aide program presents some problems in the utilization of the clinical facilities. We are a teaching hospital and have professional student nurses who rotate through the various clinical areas for experience. CoOp nurse aides who are for specific areas are not available for assistance in the clinical areas that may have the greatest need because of their restricted nature. In our previous experience with CoOp programs, we have been able to utilize the services of the CoOp nurse aide in the area that did not have students and was in need of more staff to assist in morning care. In our commitment for child care aides, when our census in these highly non-predictable areas of pediatrics and nursery was low, we were often overstaffed in these areas but could have utilized the staff other places.

*See PART II - Section 4, Health Centers.

This has been a very interesting and highly rewarding experience for our educational staff. Our patients have gained from the enthusiastic students who gave loving care. The students have matured and become more confident in their abilities and we think that in some way this experience with us has helped them to think more about their futures. This was a good program this year. But because Providence Hospital is a teaching institution with a commitment to the education of nursing students, we cannot take a specialized program on the nurse aide level for Child Care Aides.

Perhaps a hospital like Children's, or a nursery school setting, of facilities for the handicapped child may be able to utilize the services of a Child Care Aide to a greater advantage than we can at this time.

Sincerely yours,

Mary Morris/ne (Signed)

(Mrs.)Mary Morris, R.N.
Assistant Director
In-Service Coordinator

EMPLOYER EVALUATION
OF VOCATIONAL
CHILDCARE PROGRAM

A,B,C,D,E, (EMPLOYER) June 6, 1967 (DATE)

Recognizing that improvement can always be made... I would appreciate your honest evaluation of this past year's program. Do not be concerned about hurting my feelings, or the feelings of the girls. We can only improve if you can be very frank, and express what you truly feel.

1. How well have the girls performed in relation to your orginal expectation of high school students?

   A. Better than I expected.
   B. As I had a very good experience previously with high school, Sue performed as well as I had expected.
   C. Much better than I had expected.
   D. Johnnie has shown much initiative in her work, her ability to get along well with people has helped her along. Her attendance, punctuality were excellent.
   E. One did very well. One failed in attendance.

2. Which areas do you personally feel they excel in? In which areas do they need help? Would you feel you could turn any part of your program over to them completely? (If so, which area or areas?)

   A. Responsibility to the children.
      Some ways to handle "hard to handle children".
      Outdoor play, story time, free play time, painting.
   B. I thing Sue's best point is her preceptiviness her insight into their needs and the fact that she is very adaptable.
   C. I feel that Helen would work into any nursery situation well, but have never turned any part of program over to her.
   D. Didn't answer.
   E. They are good in the housekeeping area.
      They are able to have complete charge.

3. Would you recommend the program to other employers? Please state reasons for or against.

   A. Yes. These girls have proven to me that I did need young people to work with children. They have a new, fresh approach. They give the teachers a breathing spell. I have found good girls to stay and work permanently. (I save ads this way!)
   B. Yes.
   C. Yes.
   D. Yes. I feel this is a means of gaining valuable experience toward a specific skill as well as a possibility for future employment.
   E. Yes.

4. Did you feel your assistant or aide (our girls) functioned well in her capacity? How much actual responsibility did she have?

   A. Yes. As much as she could take and wanted.
   B. Yes. Sue had the complete responsibility (along with one other employer) of the after school program.
   C. Yes.
   D. Yes. She has taken complete charge of games at circle activity, initiated the art activity on occasion, hand washing and bathroom, and story reading and taking attendance.
   E. Yes. They helped set up the nursery, took complete charge of the housekeeping, one aide helped serve refreshments.

5. How often do you personally feel the girls should be rated? (4 times a year is the recommendation made by the high school) reasons?

   A. I'd like to rate them only 1 time each semester, but I'd like to communicate by phone with the school about 2 times a semester.
   B. 3 times--after the first 6 weeks--middle of year--end of year.
   C. More times than this year. To have closer contact with the girls and the school.
   D. Over a period of time, the girls begin to learn to work with more ease, and find more areas to move about and the rating should show growth.
   E. 4 times is agreeable.

6. Would you prefer that I came and observed them on the job on each of these occasions, or at a time when nursery is not in session? Would it help to have the girls in on the evaluation when I make my visits?

   A. This is not necessary. Everyone makes his own evaluation. I think too many get cumbersome--changes view points.
   B. Yes--I think a three person evaluation would work well.
   C. I don't think it would be necessary for you to observe the girls on the job each time. Perhaps once or twice the girls could be with the employers and you during the evaluation.
   D. Yes to both of these.
   E. I prefer the vocational coordinator and also the girl be present at the evaluation.

7. Did our time schedule suit you? If not, what recommendations would you make?

   A. Seemed fine.
   B. Yes, for after school. However, I feel that Sue was not able to use all of the things that she has learned in the after school situation--as this is primarly a free play time.
   C. Yes.
   D. Yes, but I feel it would be beneficial to let the girls go on experience trips with the children.
   E. Yes.

8. The girls have been paid $1.25 per hour during training period. What salary do you personally feel they may expect or be entitled to on their jobs upon graduation from high school?

   A. $1.50 per hour.
   B. $1.50 per hour.
   C. $1.50 per hour.
   D. $1.50 per hour.
   E. It depends on the girl.

9. If I'm not being too personal what salary do your adult aides earn per hour? (a rough figure please...do not answer, if you prefer not to)...

A. $1.50 in the starting salary.
B. No answer.
C. Between $2.00 and $3.00 per hour.
D. Between $2.00 and $2.25 per hour.
E. No answer.

10. Do you plan on retaining the girl you've helped train this year? If not, why not?

A. I plan to hire one.
B. I would definitely like to have Sue on my staff.
C. I would like very much to retain Helen, but I am not sure that she wants to remain.
D. ?
E. Depends on the girls.

11. Would you be interested in taking on another student next year? We have interviewed personally each and every girl and really have an outstanding group coming in. We've learned a good deal about girls this year and expect to have greater success with larger number of girls next year...

A. October in the half day school. I need girls in the p.m. maybe (1-6 or 2-6 or 3-6) in my all day school.
B. Yes--as soon as you feel they are ready to begin.
C. Yes.
D. Yes, I am not totally informed on opening date.
E. Yes. I would like to have the girl or girls attend our orientation before they start working. We plan to start the nursery Oct. 3, but orientation will be at the end of Sept.

12. Your opinion of the program.

A. Excellent!! The girls showed definite improvement as the weeks rolled on.
B. For starting from scratch I think you have done a wonderful job--naturally, you will find that you will want to change many things but its been a big help to me as an employer and most of all I think it has been a tremendous value to your girls.
C. Very fine--a very good job for a new program and a very good relationship between your department and the nurseries.

D. I feel the program is definitely an asset to the girls, as well as the communities from which they came. The experience gained will help them decide on definite areas of employment or can be applied in the future as a mother and fit into the business world.

E. I think it was a very good learning experience.

13. Please write a "job description" as you see it, at your nursery.

A. 1. Learn about children on the job--by asking questions.
   2. Station themselves in an activity spot, painting, puzzles, housekeeping, dough, water play and crafts.
   3. Assist children at the sink or toilet room.
   4. Take over stories--rhythms.

B. As far as job description goes, all I can say is its being a jack of all trades,

C. To work in the areas that we need people in. The program is not structured and the school is small so the program is not planned far ahead.

D. 1. Art Activity-(Make a stuffed fish).
   2. Pass materials--(scissors, staplers, newspaper, paint and brushes.
   3. Give each child a pre-cut fish (2 Pieces) ask him to put them together and staple one side. Cut paper and stuff fish, staple together. Instruct children to paint fish all over. Draw its eyes and mouth with a paint brush. Let them help you wash paint brushes, roll up newspaper and wash tables.

E. Help to set up the nursery, help the teacher during the session.

COMMENTS OF "COOPERATIVE NURSERY" GROUP

President (upon being approached as to using the nursery for a possible training station)

President:

August "CoOp Nurseries do not hire other than a head teacher--but I will suggest the possibility of a CoOp student to our board.

September "Our board feels having a student would be very nice. We do not feel we could pay her, unless you could also provide an afternoon girl. It wouldn't be fair to remove money from our treasury when only one of our groups would benefit."

High School Teacher-Coordinator:

November 1st Pat was placed in the nursery as a volunteer in November--The High School Instructor wanted someone in the class to have the experience of participating in a Parent Cooperative Nursery.

CoOp Nursery Teacher:

November 21st "Patty is wonderful, she's so much help and the children adore her. She catches on so fast."

December 15th "The board met last night and upon my recommendation decided to pay Patty. She is doing so very well and is such a help. She's familiar with routine and equipment and is able to help. We want to pay her whatever the other girls are receiving. Can you tell me what it is? Could you supply us with another student for the morning Pat is in your class?"

January "Have you found another girl for us yet?" (None were available)

February "You haven't forgotten we are hoping for another girl?"

March "It's so nice having Betty. I think she will work very well. (Unfortunately Betty had a poor school attendance record and although she worked at the CoOp Nursery only one day a week--she often failed to report for work or call in to explain her absence.)

Parent of a child in a CoOp Nursery comments:

"Patty is such a lovely girl and helped our program so much. I understand she's being considered for a position at _____ _____. I would like to write an unsolicited letter of recommendation in her behalf. Could you give me the correct spelling of her last name?"

Drayton Avenue
Co-operative Nursery
2441 Pinecrest Drive
Ferndale, Michigan 48220

May 29, 1967

Mrs. Theda Connell
Home Economics Department
881 Pinecrest Drive
Ferndale, Michigan 48220

Dear Mrs. Connell:

On the behalf of the entire nursery I want to tell you how pleased we have been with the pilot training program in which we participated this year.

Patty, especially, was a wonderful help and we really enjoyed having her with us.

We are looking forward to working with the program again next fall.

Sincerely,

Joan Schiffer (signed)
Mrs. Henry A, Schiffer
Secretary

Huntington Woods-Southfield
Children's Nursery
10495 W. 11 Mile
Huntington Woods, Mich. 48070

Mr. John McGregor, Principal
Ferndale High School
Ferndale, Mich.

Dear Sir;

I want to let you know that the Ferndale Co-operative Program is one of the best programs that I have ever experienced. I have cooperated with other high schools but have not found one to equal your set-up with Mrs. Connell in the Nursery School. The girls improve as time goes on and they show definite promises of becoming good workers with healthy attitudes toward their chosen occupations.

Mrs. Connell is very complete in detail, in description and in communication. Her girls are excellently prepared and have a very good attitude. I really benefited this year and wish to have more girls next semester. We plan to have three schools by Sept. I have also decided to cooperate only with Ferndale and not with the other high schools.

Very truly yours,

Mrs. Earl Gormaine,
Owner and Director

SAMPLING OF "EMPLOYER COMMENTS"

Owner-Director of three Daycare Centers

"It's a wonderful program. It's about time the Home Economics people woke up to their potential in this area....it not only prepares the girls for a vocation--but even more--will help them to be better mothers someday.

Private School in Oakland County

"This is a wonderful, wonderful thing you are doing," said with great sincerity and much warmth.

"You have a very unique program--thats very much needed. We've had professional people work with us and cleaning attendants, but never anyone in between, that had training in child development plus skills required for setting up materials. You are providing a real service to employers."

"I could use two graduates, full time in fall and would be interested in four CoOps. I like the idea of having some girls you've trained and also the opportunity to help train others. Would $1.75 an hour be acceptable?"

Neighborhood Settlement House

"Workers such as you are training are very badly needed. We're a Community Agency that cannot hire staff below the professional level--other than neighborhood women under OEO Program. But how nice it would be to have such a trained person. Hope the students can make enough money to encourage them to stay in the field. They are badly needed...

Headstart Program in Oakland County

"If we could only have the freedom to hire whom we choose. We would certainly prefer to hire trained persons such as your program offers."

Private Nursery in Warren

"I read about your program in the Free Press and would be very interested in hiring two of your girls for my nursery. What wages are you requesting for the girls?"

Warren Nursery

"Are their any schools in our area with a program like yours? I'd very much like to participate."

Private Nursery in Oakland County

"I'm expanding my program and could use 2 girls full time, 2 CoOps in morning and 2 CoOps after school hours.

Private Nursery In Wayne County

"While we are too far away for your CoOp program, I would be very interested in hiring your graduates."

Mothers seeking Childcare workers for private homes

"Your program sounds wonderful! I'm sorry you are unable to supply the homemakers needs for childcare workers."*

* Our program next year will have a separate division titled "Introduction to Childcare." We hope to supply community needs for "Childcare in the Home" by setting up a student operated "Agency" for same.

EVALUATION BY PARENTS OF HOME
ECONOMICS NURSERY SCHOOL LABORATORY

PARENTS A, B, C, D, E, F, G, H, I, J, K, L, M

1. What was your purpose in sending your child to our nursery school?

   A. Lack of playmates at home (other than mother)
   B. So she would have group experience before starting school.
   C. Tim was alone each morning with no companionship his age. He missed this since he is rather a social person?
   D. He was much to close to me and needed to learn to play with other children.
   E. Mostly someone to play with. The youngest of a large family needs lots of companionship besides Mom. Anyway, I love the two hours in the A.M.
   F. He was home alone so I decided to try and get him in a nursery.
   G. So she would learn how to share and play with other children.
   H. So he would be playing with other children his age. Also learn to get along with other children, and, he was lonesome when other children were in school.
   I. So she would have company.
   J. Very restless and no playmates his own age.
   K. He has no children his own age to play with in the neighborhood he had only older children to play with.
   L. Mrs. Friedman and Mrs. Peterson urged me to.
   M. We felt she needed development with other children. (People)

2. Has our school lived up to your expectations of it?

   A. Yes.
   B. Yes.
   C. This is my first experience with this type of class so I had no actual expectations, but I was certainly pleasantly surprised.

D. Yes, very much so.
E. Yes, and far more.
F. Yes.
G. Yes.
H. Yes, I think he has become more self reliant.
I. Yes.
J. Yes.
K. Yes.
L. Yes, in every aspect.
M. Yes.

3. What changes have you seen in your child's behavior as a possible result of the experience?

A. Can compete with other children he plays with.
B. More outgoing, with others rather than Mom.
C. A feeling of pride and not being left out of it when brothers and sisters talk about their school, Tim has just as much to say and it is just as important about his school.

D. He will visit others for a longer length of time and he is much better at picking up after himself. He ask a question which I know originated from here which is very good.
E. Seems more observant of everything. Notices things such as magazines books, etc. Wants to do creative things occasionally.
F. Sharing with others.
G. She has learned to play with children her age.
H. He has gained confidence.
I. She has learned to give and take more. She is also more aware of things going on around her.
J. Doesn't bite nails anymore, more cheerful and gets along better with other playmates.
K. Has more to contribute at the dinner table conversations. Has developed his vocabulary--good and bad.
L. Play with children his own age much better now.
M. More aggressive, not so shy.

4. What did you especially like about our nursery school program?

A. The equipment was excellent, and the excellent attitude of the students.
B. The opportunity the children had for expression in many activities.
C. The manner in which the girls worked so closely with the kids and making them think the projects they did were done much on their own.
D. Much more time was taken with him then I possibily could have given him with his work.
E. The fact that this young man had so much physical and mental stimulation--he learned new things to do, and those two hours!!
F. Everything.
G. It helped her to gain friends.
H. The children had plenty of individual attention.
I. The smiling faces on the girls, they see enough old grouches at home.
J. Large variety of things to do.
K. The freedom of activity--the variety of activities--personalities that students provided.
L. The wonderful way the girls had with the children.
M. Self-development--hardwork.

5. Was there anything you did not like? What was it? Why did you feel this way?

A. No.
B. No.
C. No.
D. No.
E. No--everything was grand, I found it flawless.
F. No.
G. No.
H. No.
I. No.
J. No.
K. No.
L. No.
M. No.

6. What changes would you suggest for next year?
A. I feel that the teacher needs an aide, or student teacher at the beginning because of many obligations to her students, to the'subjects! to the parents of the'subjects.'

B. Possibly 3 days a week, 4 days seemed too many times for the child.
C. Analyze the class to facilitate a group in the morning and another in the afternoon.
D. None.
E. Can't think of anything.
F. Another hour or so.
G. I don't have any.
H. None.
I. None.
J. None
K. For the orientation have some of the older ones and some of the younger ones together rather than all 4 years old first and then bringing in the 3 year olds.
L. None.
M. Expansion.

7. Would you recommend it to your friends? Why?

A. Yes.
B. Yes. A very good experience.
C. Very much so. The association with other children and particularly the girls, I believe did a great deal for Tim, widened by his pride in the class, teachers and his anxiousness to go to school each morning.
D. Yes, as long as you leave room for mine!
E. Yes, if they could be lucky enough to get in. Companionship, creative play, varied art materials to explain, etc. And those two hours again!
F. Yes, it is good for them when they enter kindergarten.
G. Yes, because it helps them to be away from their mothers a little.
H. Yes, I think it is ideal for children.
I. Yes.
J. Yes.
K. Yes.
L. Yes--good for the child, but more important good for the high school girls that are interested.
M. Yes.

8. Would you send a younger brother or sister of your child?
A. Yes.
B. Yes.

C. I sure would!
D. Yes.
E. Yes--but this answer doesn't indicate the hope of being able to do so in the future!
F. If I had one (SMILE!)
G. Yes.
H. Yes, if there were any younger ones.
I. Yes.
J. Yes.
K. Yes.
L. Interested, yes.
M. Yes.

9. Did you like our orientation process? (Private interview with parent and child before school opened..parent remaining with child first few days of school?)

A. I felt that by remaining the first day, a child expects one to remain succeeding days.
B. Yes.
C. Great! This would seem to break the gap of the child breaking away from mother, although I don't really believe it bothered Tim very much.
D. Yes.
E. Very good.
F. Yes.
G. Yes.
H. Yes.
I. Yes.
J. Didn't have any.
K. Private interview very good--but actual entering program may have to vary with differing children's response--a little flexibility here perhaps.
L. I personally would rather just have a few minutes stay with the child the first day.
M. Yes.

10. Have you been satisfied with the visiting arrangements and consulting with the teacher? How might they have been improved?

A. Yes.
B. A private interview half way through or end of year.
C. Yes
D. Yes.

E. Very satisfied, we always seemed to be able to talk if we wanted to.
F. Yes. None.
G. Yes.
H. Satisfied.
I. Yes.
J. Yes.
K. One scheduled private conference might be by telephone.
L. Yes.
M. Yes!

PROJECT DIRECTOR'S COMMENTS

(See Part I, page 16-17.)

FINAL EVALUATION BY NURSERY SCHOOL STUDENTS

1. What has this course done for you? How did your parents feel about it in September? How do they feel now?

No. I "When I started childcare I had no idea what I was getting into, I just figured, oh well...it's a credit. I really didn't care at all. Later when I heard we were going to operate a nursery and go out on a job working with children, that sounded great because I've always liked children and now I would have a chance to see what I could do for them."

"Now that the year is over I can say I actually think I've learned more in this class than in my other classes. I know I don't know everything about children and why they do certain things, but I feel you just can't learn enough about a group of children or one specific child in one year."

"My parents in September really weren't to happy that I took this class because they wanted me to take other classes that would prepare me for college. After I started explaining to them what it was about and some of the things we were going to do, they thought it might be worthwhile because I like children. Now my parents feel that this class has helped me to find myself and that this probably helped keep me interested in school. They feel this has helped me to communicate better with adults as well as children, and they hope I continue this work in the future. They also think . that this course was a great opportunity."

No. II "This course has made it easier for me to meet and be with people. I had expected in the beginning to be a babysitter. This course did not meet up to my original expectations, and I'm very glad it didn't!

(Copy of parent letter)

May 16, 1967

Dear Mrs. C nnell.

Just a note to express my appreciation for your wonderful influence on Sue. Through this class Sue has been able to communicate with adults, children and most of all us (her parents). Sue and I have had many and varied, very personal conversations as a result of discussing chapters in the text, projects for the children and just plain listening to Sue relate her experiences in the nursery.

I would (as a parent) urge the school to continue the "childcare program." I am very proud as a parent that Sue has had this opportunity. It can be successful at the "Junior" level. A big "thanks to Mrs. Connell".

Sincerely,

Mary V. A.

*VOCATIONAL EDUCATION; *STATE PROGRAMS; *PROGRAM DESCRIPTIONS; *PROGRAM IMPROVEMENT; *STATE DEPARTMENTS OF EDUCATION
OHIO

This report of projected plans for vocational education in Ohio was prepared to give directions to leadership activities in assisting local schools with expansion and improvement of vocational education. The report is divided into two main sections. The first part concerns the current year and includes sections on employment opportunities, program offerings, work study programs, and the state committee for vocational education. The second part concerns the plan to extend and improve the state's program during the year. Sections are included on high school program priorities, post-high school program priorities, adult program priorities, disadvantaged program priorities, area school construction plans, and current plans for strengthening programs. Data are provided to support the plans and priorities. (JM)

June, 1966

PREFACE

Vocational Education is justified by the contribution it makes to the development of the individual to the fullest extent of his capacities for making a constructive, gainful livelihood. Some may think of this in terms of an efficiency measure of the individual to live with himself and to participate in our society, while others may think of it as a measure of conservation of the nation's greatest resource, manpower. Irrespective of how we wish to view Vocational Education in this many-sided socio-economic pattern of life, we know the pattern change to be quickening in pace at an increasing rate. If education is to keep its place in the development of man for living in these modern times, then it must also quicken its pace of change to adjust to this modern change.

The educational services for people should be provided at the local level, but unfortunately the schools at the local level many times lack the finances and the personnel necessary to bring about the change in education needed to keep it abreast of the changing times. The Federal Government through its educational acts in the last decade has provided a great impetus which should produce an immeasurable change in education in the United States. However, we are a long way from achieving the goals set forth in the acts. The State Department is in a particularly favorable position, with the help of the Federal Government and the proximity to the local community, to provide the kind of leadership which will assist the local schools and communities to provide the quality and quantity of vocational education programs which will meet the needs of all persons in all communities and keep it abreast of the changing world.

This report of the projected plans of the Department of Education, Division of Vocational Education was prepared to give direction, with the cooperation of the Federal Government, to leadership activities that will assist the local schools in achieving an expanded and improved program of Vocational Education throughout the State adequate to meet and keep abreast of the modern changing pattern of socio-economic life in Ohio. It should be understood, however, that at the present rate of funding we cannot achieve the educational goals set forth in this plan for many years. Our annual projected plan, therefore, cannot change radically from year to year if we are to achieve our goals.

PART A

Items Related to Ohio's Total Program of Vocational and Technical Education Which Will be Operated During the Current Year

1. Current and Projected Manpower and Employment Opportunities

a. Occupations or Occupational Fields or Levels
b. Educational Levels

Current and projected manpower needs and employment opportunities were studied from two directions for planning vocational and technical education programs. They were unemployment as an index of trained personnel and potential personnel to be upgraded and retrained, and manpower needs and employment opportunities reported in occupational surveys as an index of positions for which people should be trained.

Exhibit A, Unemployed Personnel Seeking Jobs Through Ohio State Employment Service April 1, 1967, presents manpower needs and employment opportunities indirectly by presenting unemployment in Ohio.

For men the report shows two general trends: Occupational Trend, as the occupational level decreases the number and the per cent of the unemployed increases; and Age Trend, as age approaches the 25 to 34 age group from either direction the number and the per cent of the unemployed increases. See page 1 of Exhibit A.

This combination of trends produces a scatter diagram of occupational levels and age groups with the greatest number and per cent of unemployed in entry occupational level under 19 age group which moves toward the higher occupational levels from entry under 19 through unskilled, semi-skilled, then skilled occupational level as age is increased. Those men in the concentrated portion of the scatter diagram make up that group in which sufficient numbers can be more satisfactorily recruited for establishing, retraining and upgrading programs. See page 1 of Exhibit A.

This points up the need for vocational and technical education for entry, unskilled and semi-skilled occupational levels for ages under 19 to 25 into higher occupational levels--skilled, service, clerical and sales--and continuous upgrading and retraining for ages 25 through 65 and over in unskilled, semi-skilled, skilled and service occupations.

For women, except for professional level occupations, the report shows two general trends: Occupational Trend, as the occupational level moves upward or downward from the skilled occupational level the number and the per cent of the unemployed increases; and Age Trend, as age approaches two

age groups 19 to 21 and 25 to 34 from either direction the number and the per cent of the unemployed increases. See page 2 of Exhibit A. In essence this is a bimodal curve at these two age groups.

This combination of trends produces a scatter diagram of occupational levels and age groups with the greatest number and per cent of unemployment under age 19 in the entry occupational level which moves into higher occupational levels of unskilled and semi-skilled as age increases from under 19 to 35 to 44 age group. There is also a corresponding high number and per cent of unemployed in clerical and sales occupations beginning at age 19 to 21 which moves downward into service occupations at about 25 to 34 age group. Both sets of frequencies continue through 35 to 44 and then taper off. The two concentrations of frequencies found in women are due to the fact that skilled level is in between them and few women are employed at this level. Those women in the two concentrated portions of the scatter diagram make up that group in which sufficient numbers can be more satisfactorily recruited for establishing, retraining and upgrading programs. See page 2 of Exhibit A.

This points up the need for vocational and technical education for unemployed in entry, unskilled and semi-skilled occupational levels for ages 19 to 44 into higher occupational levels, broadening the training in the clerical and service area from age group 19 to 21 to age 35 to 44 and the broadening of the areas of training for women to include appropriate skilled areas in which they will be able to work with increasing age.

Exhibit B_1 B_2 B_3, Projected Manpower Needs and Employment Opportunities, presents manpower needs and opportunities directly.

Occupational Surveys made by Manpower Advisory Committees in Cooperation with the Manpower Development Section, Ohio Bureau of Unemployment Compensation, presents future manpower needs for replacement and expansion for 24 month period as reported directly from employers for specific occupations surveyed. They are then grouped into occupational levels.

The Toledo (Lucas County) Occupational Survey, December 1965, is submitted as Exhibit B_1 and as an illustration. Table 1, Employment and Reported Needs in Toledo (Lucas County) Occupational Survey for 24 Months by Occupational Groups, April 1965, shows a gross need of 19,447, with greatest demands of 3,480 in skilled occupations and 3,224 in clerical. See page 33 of Exhibit B_1.

Table 2, Occupations Showing Greatest Demand in Toledo (Lucas County) Occupational Survey, April 1965, lists the occupations showing greatest demand from the 165 surveyed and the 24 month need. See pages 2 and 28 of Exhibit B_1.

Table 1:--Employment and Reported Needs in Toledo (Lucas County)
Occupational Survey for 24 Months
by Occupational Groups, April 1965

Occupational Levels	Current Employment		24 Month Needs		
	Total	Female	Replacement	Expansion	Gross
Total	134,482	41,038	9,413	10,034	19,447
Professional and Managerial	18,326	6,122	1,495	1,024	2,519
Clerical	23,989	15,884	1,752	1,472	3,224
Sales	12,894	4,558	854	1,269	2,123
Services	13,932	6,903	1,409	835	2,244
Skilled	25.645	789	1,401	2,079	3,480
Semi-skilled	23,247	4,928	1,098	1,831	2,929
Unskilled	16,449	1,854	1,404	1,524	2,928

Table 2:--Occupations Showing Greatest Demand in Toldeo (Lucas County)
Occupational Survey, April 1965

Occupation	Demand for 24 Months	Occupation	Demand for 24 Months
Assembler	730	Laboratory Technician	151
Auto Body Repairman	132	Laborer	2643
Auto Mechanic	240	Machine Operator	426
Auto Service Station Attendent	200	Machinist	259
Beauty Operator	95	Maintenance Man	106
Bookkeeper	150	Maintenance Mechanic	126
Cashier	297	Nurse LPN	203
Central Office Repairman	121	Power Press Operator	317
Checker	125	Pressman Printing	162
Clerk, General Office	1067	Salesman General	853
Clerk Typist	543	Salesperson Retail	817
Coil Assembler	107	Secretary	85
Cook	294	Sewing Machine Operator	339
Draftsman	233	Sheetmetal Worker	137
Electric Motor Repairman	101	Stock Clerk	310
Electrician	182	Telephone Operator	178
Foreman	136	Tool and Die Maker	162
Inspector	95	Upholsterer	128
Insurance Salesman	453	Waiter/Waitress	1024
Janitor/Maid	305	Warehouseman	285
		Welder	109

Key summary facts from the survey are:

The 165 occupations studied here represent 82 per cent of the total employment in Lucas County. Manufacturing provides the most jobs -- 36 per cent -- Wholesale and Retail Trade is next with 22 per cent.

Around 70 per cent of the jobs are held by men and 30 per cent by women. An increase in the proportion of females in recent years.

Of the 165 occupations 54 show significant need -- 39 will offer little or no chance for employment. Openings will develop in all fields but skilled and clerical workers will find the most opportunities.

Gross needs in nonmanufacturing are almost double those in manufacturing -- replacement needs are somewhat larger than expansion needs.

There is a significant amount of commuting in and out of Lucas County with a net gain of 9,324 to the total work force.

Recent technological developments will necessitate more scientific, engineering personnel, and supporting technicians and craftsmen. Future outlook is for rapid changes and steadily increasing complexity of the content of many professional, technical and skilled occupations.

Demand will exceed the supply. Many of those presently counted as unemployed are either job attached or are not trained for today's skills.

See pages 2 and 3 of Exhibit B_1.

By using these surveys in planning vocational programs, local community occupational needs are provided for.

If an occupational survey has not been made that is approximately the same as the community or the area under study for vocational programing, a composite of occupational surveys for surrounding areas have been compiled and the relationship of the region to surrounding areas studied.

Exhibit B_2 is material from the Medina County Joint Vocational School District Study which illustrates the technique of approximating local manpower needs and employment opportunities in such cases.

Forty-three and two-tenths per cent of Medina County labor force works in the surrounding counties and therefore their needs are at least an indication of Medina program needs. See page 23 of Exhibit B_2.

Table 16, Employment and Reported Needs in Clerical Occupations for Twenty-Four Months; Table 17, Employment and Reported Needs in Sales Occupations for Twenty-Four Months; Table 18, Employment and Reported Needs in Service Occupations for Twenty-Four Months; Table 19, Employment and Reported Needs in Skilled Occupations for Twenty-Four Months and Table 20, Employment and Reported Needs in Semi-Skilled Occupations for Twenty-Four Months, which are not listed here for sake of brevity, see page 24, 25 and 26 of

Exhibit B_2, show the occupational fields and the demand for 24 months while Table 21, Principal Occupational Needs for Twenty-Four Month Period from Occupational Survey Findings in Northeastern Ohio, shows the principal demand occupation and the extent of that demand for 24 months. See pages 27, 28, 29 and 30 of Exhibit B_2.

For Medina the composite showed first occupational group need to be clerical and second occupational group need to be skilled workers. In like fashion principal occupational demands were clerical, auto mechanics, cooks and bakers, machinists, maintenance mechanics, practical nurses, general salesmen, tool and die makers, etc. In selecting principal demand occupations only those consistantly found in surrounding area were included.

Another means of estimating the occupational needs and employment opportunities over the state has been the compilation of all the occupational surveys into one. Exhibit B_3 presents such information for that proportionate part of the state. Table 1, Current Employment and Reported Needs for Twenty-Four Months by Occupational Groups in Twenty-Four Counties, again indicates greatest demand for clerical and sales, then semi-skilled and skilled occupations with a total of 69,076 expansion and replacement needs. See page 7 of Exhibit B_3.

Table 15, Per Cent of Persons Working Outside County of Residence for Selected Counties in Ohio, 1960; Table 16, Employment and Reported Needs in Clerical Occupations for Twenty-Four Months; Table 17, Employment and Reported Needs in Sales Occupations for Twenty-Four Months; Table 18, Employment and Reported Needs in Service Occupations for Twenty-Four Months; Table 19, Employment and Reported Needs in Skilled Occupations for Twenty-Four Months; Table 20, Employment and Reported Needs in Semi-skilled Occupations for Twenty-Four Months, see pages 26-31 of Exhibit B_3, shows the occupational fields and the demands for 24 months and indicates clerical and sales and skilled in greatest demand. Table 21, Principal Occupational Needs for Twenty-Four Months, pages 32-36 of Exhibit B_3, list the occupations in greatest demand. For sake of brevity the listing is here omitted.

To further supplement this information on occupational needs "Ohio Labor Market" gives information on industries, jobseekers, labor market and labor force by counties. See pages 1-6 of Exhibit B_3.

c. Different Labor Market Areas or Communities of the State

The labor market areas are approached from two directions for planning vocational and technical education programs. They were unemployment as an index of trained personnel and potential personnel to be upgraded and retrained, and manpower needs and employment opportunities reported in occupational surveys. The manpower needs and employment by occupations or occupational field and by labor market areas or communities are so closely related that it is difficult at times to separate one from the other. In studying occupational group needs it should be defined as within a geographic area, and within a geographic area it should be defined concerning specific occupations. For that reason we shall refer to previous text on occasions to save repetition.

Manpower need and employment opportunities for the State of Ohio were discussed under Occupations or Occupational Fields or Levels. In this discussion various trends and resulting facts of importance were listed for occupation groups and ages for the state as the labor market area.

Exhibit A also presents men and women seeking jobs through employment service by occupational group and age group by counties. Now for counties as the area, the labor market takes on a slight variation from the state labor market area and each must be considered individually.

Shortage and surplus occupations first quarter 1966 for the state and counties were:

Shortage occupations for men

Machinist (44 counties) -- Allen, Athens, Auglaize, Belmont, Butler, Champaign, Clark, Columbiana, Coshocton, Crawford, Cuyahoga, Darke, Defiance, Erie, Franklin, Geauga, Hamilton, Hancock, Hardin, Hocking, Huron, Knox, Lake, Licking, Logan, Lorain, Lucas, Mahoning, Medina, Mercer, Miami, Montgomery, Muskingum, Ottawa, Portage, Sandusky, Scioto, Seneca, Stark, Summit, Trumbull, Tuscarawas, Warren, Wood.

Draftsmen (31 counties)

Engineers--chemical, civil, electrical, industrial, mechanical (28 counties)

Tool and die makers (27 counties)

Welders (25 counties)

Electricians (19 counties)

Automobile mechanics (18 counties)

Machine operators, miscellaneous (18 counties)

Engine and turret lathe operators (16 counties)

Salesworkers (16 counties)

Accountants (14 counties)

Milling machine operators (10 counties)

Social workers--case and group (10 counties)

Repairmen--electrical and electronic (8 counties)

Boring machine operators (7 counties)

Electronic technicians (7 counties)

Factory maintenance mechanics (7 counties)

Foremen (7 counties)

Managers, miscellaneous (7 counties)

Millwrights (7 counties)

Setup men (7 counties)

Tool and die designers (7 counties)

Chemists (6 counties)

Press operators--punch, drill, forming (6 counties)

Clerical workers (5 counties)

Grinders (5 counties)

Job setters (5 counties)

Machine tool operators (5 counties)

Patternmakers (5 counties)

Repairmen, television (5 counties)

Screw machine operators (5 counties)

Shortage occupations for women

Secretaries (35 counties) -- Ashtabula, Butler, Columbiana, Coshocton, Cuyahoga, Defiance, Fairfield, Franklin, Geauga, Greene, Hamilton, Hardin, Holmes, Huron, Jefferson, Knox, Lake, Logan, Lorain, Mahoning, Marion, Medina, Morgan, Muskingum, Ottawa, Portage, Sandusky, Stark, Summit, Trumbull, Tuscarawas, Warren, Washington, Wayne, Wood.

Nurses, practical (30 counties)

Stenographers (30 counties)

Nurses, registered (23 counties)

Waitresses (23 counties)

Bookkeepers (14 counties)

Clerk-typists (13 counties)

Cooks (13 counties)

Housekeepers (13 counties)

Domestics (12 counties)

Nurse aides (11 counties)

Child monitors (9 counties)

Social workers--case and group (9 counties)

Medical technicians (7 counties)

Salesworkers (6 counties)

Home care attendants (5 counties)

Maids (5 counties)

Pressers (5 counties)

Surplus occupations for men

Construction laborers (65 counties) -- Adams, Allen, Ashland, Ashtabula, Athens, Auglaize, Belmont, Brown, Butler, Champaign, Clark, Clermont, Clinton, Columbiana, Coshocton, Cuyahoga, Darke, Defiance, Delaware, Fairfield, Fayette, Franklin, Gallia, Geauga, Guernsey, Hamilton, Hancock, Hardin, Henry, Highland, Hocking, Huron, Jackson, Jefferson, Knox, Lake, Lawrence, Licking, Logan, Lorain, Madison, Meigs, Mercer, Miami, Monroe, Montgomery, Morgan, Muskingum, Ottawa, Pickaway, Pike, Portage, Richland, Ross, Sandusky, Scioto, Seneca, Shelby, Stark, Trumbull, Union, Van Wert, Vinton, Warren, Washington.

Truck drivers (65 counties)

Carpenters (40 counties)

Factory laborers (36 counties)

Painters (24 counties)

Operating engineers (20 counties)

Heavy equipment operators (19 counties)

Bricklayers (17 counties)

Finishers, cement (13 counties)

Press operators--punch, drill, forming (12 counties)

Assemblers (11 counties)

Janitors and porters (11 counties)

Bulldozer operators (10 counties)

Surplus occupations for women

General office clerks (38 counties) -- Brown, Butler, Carroll, Champaign, Clark, Clermont, Clinton, Columbiana, Darke, Fayette, Fulton, Greene, Hancock, Hardin, Harrison, Henry, Highland, Jackson, Jefferson, Knox, Lawrence, Lorain, Miami, Monroe, Montgomery, Morrow, Muskingum, Paulding, Pickaway, Pike, Richland, Ross, Scioto, Tuscarawas, Van Wert, Warren, Washington, Wood.

Salesworkers (35 counties)

Waitresses (31 counties)

Assemblers (29 counties)

Packers (25 counties)

Cashiers (18 counties)

Clerk-typists (13 counties)

Sewing machine operators (12 counties)

Press operators--punch, drill, forming (10 counties)

See pages 1-8 of Exhibit C.

By selecting and combining there are labor market areas for each of the eight largest counties, the eight large counties and all other counties. In these three labor force areas the trends are very similar to those of the state as a whole. See pages 3-10 of Exhibit A and pages 13-18 of Exhibit C.

The Occupational Surveys made by Manpower Advisory Committees establish a labor force area for each of the studies. In some cases they coincide with governmental county boundaries but in many cases they cross these boundaries to include industrial area effects. Likewise when the occupational surveys are combined into special arrangements for specific area studies or for a composite of the state, they set up labor market or force areas. These were discussed in the original discussion of occupational surveys for occupations and occupational fields and are a sum of the individual occupational survey areas.

To supplement the facts on the eight largest counties, the labor market information on eight metropolitan areas of Ohio gives supply and demand. Toledo metropolitan area includes Lucas and Wood Counties in Ohio and Monroe County in Michigan. See pages 9-12 of Exhibit C.

2. Program Offering by Occupational Categories by Purpose of Counties

Table 3, Number and Location of Vocational Education Programs by County, lists by counties the number of vocational education programs in each category according to purpose.

3. Program Offering in Area Vocational Schools

Table 4, Vocational Education Programs in Area Vocational Schools, lists by area vocational schools the vocational programs in each category according to purpose.

Map 1, Status of Area Vocational Schools in Ohio Fy 1967, categorizes them in 5 groups: N, school districts which have schools that will be in operation for the first time during the year; O, school districts which have schools that have been in operation; C, school districts which will be doing some construction; F, school districts whose application for a joint vocational school district has been approved by the State Board of Education and they have requested building construction assistance; J, school districts whose jointure for an area vocational school district has been approved by the Ohio State Board of Education but as yet have not requested construction assistance.

4. The State's Plan for the Provisions of Work-Study Programs Under the 1963 Act

a. Plan of State Administration

The State Board of Education is responsible for the overall administration of Work-Study Programs conducted under the State Plan. The State Board of Education's responsibility for approving and supervising the administration of Vocational Education Work-Study Programs by local educational agencies is implemented through the Division of Vocational Education. The Director of the Division of Vocational Education through the Supervisor of Disadvantaged Youth and Work-Study Programs is specifically responsible for administering standards established by the State Board of Education for the approval of school districts for participation in the Work-Study Program. He is also responsible for planning a budget in keeping with the Federal and State Allocations for the Work-Study Program and the approval of individual students for participation in Work-Study Programs submitted from schools having prior approval from the State Board of Education. The Supervisor of Disadvantaged Youth and Work-Study Programs is also responsible for providing supervision, coordination and leadership in terms of program development.

b. Estimated Number of Local Educational Agencies and Number of Students Likely to Participate

On the basis of the development of Vocational Education Work-Study Programs over the past two years it is estimated that seventy local educational agencies will be participating in the program in 1966-67. Approximately three thousand students will be expected to participate in this program next year.

PART B

Items Indicating Ohio's Plan to Extend and Improve the Vocational Education Program During the Current Year With the Place of Emphasis and Justification

Part A1; a, Occupations or Occupational Fields or Levels; b, Educational Levels; and c, Different Labor Market Areas or Communities of the State supported by Exhibits A, B_1, $_2$, $_3$ and C pointed up in detail occupational level trends and age trends in unemployment and occupational level and specific occupations which are in principal demand for various labor market areas and the State.

In brief these are the findings that indicate where the emphasis for priority of expansion and improvement should be placed and justify such emphasis in Ohio.

For men: the greatest number and per cent of unemployed in entry occupational levels under 19 age group which moves toward the higher occupational levels from entry under 19 through unskilled, semi-skilled, then skilled occupational level as age increases.

For women: the greatest number and per cent of unemployment in entry occupational levels under 19 age group that moves into higher occupational levels of unskilled and semi-skilled as age increases and a corresponding high number and per cent of unemployed in clerical and sales occupations beginning at age 19 to 21 that moves downward into service occupations at about 25 to 34 age group which make two groups of unemployed because skilled level is in between the two with few women employed at this level.

For principal demand occupational levels and occupations and the shortage occupations: the list is not repeated here, see pages 3 and 7.

These justify need for vocational and technical education.

Justification	With Emphasis in
1. for entry, unskilled and semi-skilled occupational levels, for ages under 19 to 25.	High school All vocational services
2. into higher occupational levels - technical, skilled service, clerical and sales.	Post high school High school All vocational services

3.	for continuous upgrading and retraining for ages 25 through 65 and over in unskilled, semi-skilled, skilled and service occupations because of the great number of persons who should originally have been trained for higher occupational levels, the marginal trained who becomes obsolete as technical advancements are made and the great number of high school students who attempt to enter employment without skills and knowledgement.	Adult All vocational services
4.	for the broadening in the training of certain fields to make persons more flexible.	High school Business Education Agricultural Education Distributive Education
5.	for the increase in the occupational fields in which women are trained.	High school Skilled (T & I)
6.	for the demands in specific occupational levels and occupations.	High school Business Education Distributive Education Trade and Industrial Education

1. Program Priorities to Expand Vocational and Technical Education for High School Students for the Current Year as Related to Manpower Needs and Employment Opportunities in Part A

The State's emphasis on program priorities to expand vocational and technical education for high school students for the current year is indicated by the fact that approximately 6 times as many new programs will be added in F. Y. 1967 as was added in F. Y. 1965. Also a second emphasis is the continued expansion of occupational fields to be offered.

a. New Teaching Personnel Requirements
b. New and Additional Occupational Fields to be Provided

Table 6, Vocational High School Programs F. Y. 1967, presents the demand for new secondary school teachers, number of program units added, occupational fields to be provided and justification for emphasis of expansion.

c. Plans for Replacement or Purchase of New Equipment

d. Plans for Improving Facilities

Since the Foundation Programs in Ohio provides the funds necessary for the instructional costs of vocational education programs at the high school level, monies from the Vocational Education Act of 1963 will be used only for supervisors, local directors and for the replacement or purchase of

Table 6:--Vocational High School Programs F. Y. 1967

Vocational Service	Approximate Number Teachers Needed	Approximate Number Program Units Added	Justification for Emphasis	Occupational Fields to be Provided
Total	864	615		
Agricultural Education	50	10	1, 2, 4	Agricultural Business, Agricultural Equipment, Horticulture Resources Conservation, Agricultural Program for Disadvantaged Youth
Business Education	326*	326	1, 2, 4, 6	None
Distributive Education	61	46	1, 2, 6	Service Station, Super Market
Home Economics Education	250	110	1, 2	Dietary Aides
Trade and Industrial Education	177	123	1, 2, 5, 6	None

*High school program expansion will continue at an expanded rate. Whereas 194 units (4,840 students) were approved in F. Y. 1966, 520 units (more than 13,000 students) are programed for F. Y. 1967. Most of the teaching demand has been met by converting certification of presently employed business education teachers who were vocationally qualified as the business education programs were made vocation by increasing the depth of the programs.

equipment for new programs and upgrading of existing programs.

Six hundred fifty thousand dollars has been planned in the budget for the upgrading of equipment in existing programs and purchase of equipment for new programs. This money is in addition to the amount budgeted under the Vocational Education Act of 1963 for construction and equipment of new facilities.

A total of $700,000 was allotted to 305 local communities during this past year for the replacement or upgrading of equipment. This allocation did much to stimulate the improvement of vocational education programs in the local communities.

Since the greatest need in Ohio is for the expansion of facilities for programs of vocational education, it is planned that 80% of the monies allotted to Ohio under the Vocational Education Act of 1963 will be spent for

construction and initial equipment of area vocational facilities. Experience this year in allotting money for construction and initial equipping of facilities points toward the importance of this activity in the expansion of vocational education and the stimulation of local communities in considering the development of programs.

2. Program Priorities to Expand Vocational and Technical Education for Post High School Students for the Current Year as Related to Manpower Needs and Employment Opportunities in Part A

During the past several years a good beginning has been made in the development of two year post high school technical programs in the areas of engineering and data processing. With the Vocational Act of 1963 now providing an opportunity for expansion of technical education in all service areas the technical institutions are preparing to expand and improve their curriculum. The State's emphasis on program priorities to expand vocational and technical education for post high school students for the current year is indicated by the large numbers of new occupational fields to be provided F. Y. 1967 as shown in Table 7. That is, the emphasis has been put on broadening the curriculum in higher level occupations. Some will be funded for equipment and others for leadership personnel during the year of preparation for expansion and improvement for F. Y. 1968.

a. New Teaching Personnel Requirements
b. New and Additional Occupational Fields to be Provided

Table 7, Vocational Post High School Programs F. Y. 1967, presents the demand for new post secondary school teachers, occupational fields to be provided and justification for emphasis.

c. Plans for Replacement or Purchase of New Equipment

d. Plans for Improving Facilities

Since dual use for both high school and adult programs is considered in the planning and acquisition of equipment and facilities, the plans for replacement or purchase of new equipment and plans for improving facilities described in Part B-1 c.d. is also applicable to the services provided for post high school, adult and out of school youth programs. The development of more area vocational centers is providing more facilities and equipment for use in the expanding of training, retraining and upgrading programs for all post high school programs.

3. Program Priorities to Expand Vocational and Technical Education for Persons Who Have Already Entered the Labor Market for the Current Year as Related to Manpower Needs and Employment Opportunities in Part A

Ohio has for a number of years maintained a good program to upgrade and improve those who have already entered the labor force. This year particular emphasis was placed upon the expansion and upgrading of courses for per-

Table 7:--Vocational Post High School Programs F. Y. 1967

Vocational Service	Approximate Number Teachers Needed	Justification for Emphasis	Occupational Fields to be Provided
Total	116		
Agricultural Education	6	2, 3, 4, 6	Horticulture; Food Processing including Meat Management; Laboratory Technicians, Soils, Feeds; Resources Conservation
Business Education	8*	2, 3, 4, 6	Medical-Dental Secretary, Industrial Accountant
Distributive Education	11	2, 3, 6	Petroleum Services Mid-Management, Banking Services Mid-Management, Sales-Marketing
Home Economics Education	6	2, 3, 6	Dietetics Technician, Child Development Technician
Trade and Industrial Education	85	2, 3, 5, 6	Medical Assistant, Surgical Technician, Professional Nursing A.D.M.

*Post high school programs expansion will continue at an expanded rate. Whereas in F. Y. 1966 there was 1 Business Office Education and 5 Business Data Practice with 460 students, there will be 5 Business Office Education and 6 Business Data Practice with 640 students enrolled in F. Y. 1967. Again most of the teaching demand has been met by converting certification of presently employed business education teachers who were vocationally qualified.

sons employed in the fields of business and office occupations. The State's emphasis this current year on program priorities to expand and improve programs to upgrade and improve those who have already entered the labor force is indicated by the large number of new occupational fields to be provided as shown in Table 8. That is, the emphasis has been put on broadening the curriculum in the rest of the services.

c. Plans for Replacement or Purchase of New Equipment

d. Plans for Improving Facilities

In planning the equipment and facilities for high school programs consideration is given for its use in programs to upgrade and improve those who have already entered the labor market. Therefore plans for acquisition of

Table 8:--Vocational Programs to Upgrade and Improve Those Who Have Already Entered the Labor Force F. Y. 1967

Vocational Service	Approximate Number Teachers Needed	Justification for Emphasis	Occupational Fields to be Provided
Total	430		
Agricultural Education	0*	2, 3, 4, 6	Agricultural Business, Agricultural Equipment, Horticulture
Business Education	75**	2, 3, 4, 6	None
Distributive Education	120	2, 3, 6	Store Buyer, Advertising Clinics, Income Tax
Home Economics Education	5	2, 3, 6	Home Makers Guide, Home Makers Assistant
Trade and Industrial Education	200	2, 3, 5, 6	Health Occupations

*It is believed that teachers of programs for secondary, post secondary, technical, and pupils with special needs supplemented with part time specialists from related agriculture pursuits will provide this instruction.
**Adult program expansion will drastically enlarge. While 8,118 adults received instructions through 23,445 hours of instructions in F. Y. 1966. It is estimated that 9,500 adults will be served by more than 27,000 hours of instruction in F. Y. 1967. The move to accept on adult certification specialists with only high school diplomas is meeting most of the teacher demands in the narrow course offerings.

replacement or new equipment and new or improved facilities described in Part B-1 c.d. is also applicable to the service provided for programs to upgrade and improve those who have already entered the labor force. The development of more area vocational centers is providing more and better equipment and facilities for use in the expanding of vocational programs for those who have already entered the labor force.

4. Program Priorities to Expand Vocational and Technical Education for Persons With Special Needs for the Current Year as Related to Manpower Needs and Employment Opportunities in Part A

An occupational work experience program for youth with I.Q. in the 75 to 89 range has been meeting with good success in serving these students. Programs that provide a workshop type experience within the school before the student is placed upon a work experience within the community are having the best results. Where consideration is given to those disadvantaged youth who are handicapped in reading and writing the English language and the skills of arithmetic, the programs are also meeting with greater results and making enroads in the accomplishment of the academic areas.

Most of the programs have been operated under the service of Trade and Industry. The State's emphasis on program priorities to expand and improve programs for those persons with special needs for the current year is indicated by the increase in programs in new occupational fields to be provided by the different vocational services and the new types of in-school shop experience to be provided by these services.

a. New Teaching Personnel Requirements
b. New and Additional Fields to be Provided

Table 9, Vocational Program for Those Persons with Special Needs F. Y. 1967, presents the demand for new teachers of pupils with special needs, occupations to be provided and justification for emphasis.

c. Plans for Replacement or Purchase of New Equipment

d. Plans for Improving Facilities

Since the occupational work experience programs are a part of the high school program, the provisions set forth in Part B-1 c.d. are here applicable.

5. Plans for the Construction of Area Vocational Education Schools for F. Y. 1967

During the past year the State Board for Vocational Education approved the expenditure of 80% of the funds made available under the Vocational Educational Act of 1963 for construction and initial equipment of facilities for new programs of vocational education since the State foundation plan provides money for the high school vocational instruction program. During the past year fourteen different schools received an allocation of funds for the construction and initial equipment of facilities. The great need for new facilities and equipment for the expansion of vocational education was indicated by the many applications received and the requests for additional funds.

On the basis of this and on the basis of stimulation of vocational education created by the construction, the State Board of Education has approved the expenditure of 80% of the funds made available to Ohio under the

Table 9:--Vocational Programs for Those Persons with Special Needs F. Y. 1967

Vocational Service	Approximate Number Teachers Needed	Justification for Emphasis	Occupational Fields to be Provided
Total	39		
Agricultural Education	10	1	Horticulture, On-the-Farm
Business Education	4*	1	Clerical Service (cluster of low level office jobs)
Distributive Education	1	1	Occupational Work Experience
Home Economics Education	4	1	None
Trade and Industrial Education	20	1	Single and Semi-skills

*The special needs programs will be expanded. The Business Office Education approach to disadvantaged youth with the "Clerical Service" program developed in Cincinnati is expanding into five schools. No further changes are contemplated until implementation has been evaluated after two more years. Again most of the teaching demand has been met by converting certification of presently employed business education teachers who were vocationally qualified and who had taken preparation for teaching this level of student.

Vocational Education Act of 1963 for this current year for the construction and initial equipment of facilities.

Notification has been sent to tell all school districts in Ohio concerning the availability of funds and that applications must be in the office of the Division of Vocational Education by August 20, 1966, for the initial allocations. To date a number of different school districts or joint vocational school districts have requested application forms for submission of requests. It is estimated that allocations will be made to 12 to 15 school districts making applications on the basis of the priority system recommended by the State Advisory Committee and established by the State Board of Education. Factors of the priority system are indicated on the application. See Exhibit D.

a. Number and Type of Schools

b. Educational Level of Program to be Offered

c. Occupational Fields to be Provided

d. Location and Area to be Served by School

e. Relating this to Item 3, Part A.

Table 10, Information on Area Vocational Schools Under Constuction F. Y. 1967, presents number and types of schools, educational level of program to be offered, occupational fields to be provided and location and area to be served.

These 17 schools have been identified in Part A-3 in Map 1, Status of Area Vocational Schools in Ohio F. Y. 1967, by outline in orange color and symbol "C" and in Table 5, Status of Area Schools in Ohio F. Y. 1967 by symbol "C".

6. State's Current Year Plans for Strengthening Programs

The vocational education program F. Y. 1967 is crowded with activities of expansion and improvement to strengthen its service to youth and adults for preparing them for their gainful endeavors in the world of work. No service or area has been overlooked. The lists are too long to review here so a single illustration has been selected from many to show the man sized task ahead of vocational educators in Ohio for F. Y. 1967. In vocational education programs for high school level 17 area buildings will be under construction, approximately 6 times as many new programs (615) will be started as was started in F. Y. 1965 with an estimated increased enrollment of over 12,000 students in vocational education over F. Y. 1965. Over 864 new teachers this year will be in the shops and related instructional rooms. All must have help.

a. Administration and Supervision--State and Local

To meet the stupendous upsurge the services of business education and guidance have each added an assistant supervisor and increased clerical staff and operating supplies. District, regional and national seminars conducted by the U.S.O.E. are proving to be an excellent stimulus for the State staff. Plans are being made to send as many of these leaders as possible to the meetings. To meet the task at the local level reimbursement is stimulating the employment of local supervisors and directors. More than 10 new directors and more than 21 supervisors will be employed for this current year to strengthen the local administration and supervision.

b. Teacher Education

The expansion of vocational education was anticipated last year and 8 teacher educators were added to three vocational services. However to build up and strengthen the teacher training service still more, for it is this service that must assist the supervisors in meeting the demands of the over 864 new teachers, another teacher educator will be added at Toledo University in Trade and Industrial Education. Maintenance allowance is stimulating attendance at workshops. An automotive workshop had 57 in attendance this year. More workshops are planned for F. Y. 1967 to provide stimulation and instruction for employed local vocational education teachers, supervisors and directors. A one week institute will also be conducted for all new teachers before the opening of school each year.

c. Vocational Guidance Programs and Services (State and Local)

A total of fourteen two-week seminars in Vocational Guidance will be conducted at five universities centers for 280 certificated school guidance counselors in the summer of 1966. The seminars are financed by the Division of Vocational Education and co-sponsored by the Division of Guidance and Testing and the participating universities.

The Division of Guidance and Testing expanded its Guidance Services Section personnel by employing a technical and vocational guidance coordinator whose responsibility involves state-wide supervisory, evaluative, and program development functions. Such functions include supervision of state policies and procedures for guidance, the administration and recommendation of reimbursement policies, and the supervision of all reimbursable programs assigned by the State Guidance Supervisor according to the plan for guidance under the Vocational Education Act of 1963.

Plans and activities are underway for (1) the continuation of GATB training sessions, (2) the publication of the Ohio Vocational Education Notebook - a school counselor source book devoted to vocational school programs, (3) student interest surveys in technical and vocational education, (4) the production and distribution of a sound film strip designed to explain vocational and technical education to parents and school patrons.

d. Curriculum Development

In trade and industrial education development of study guides has been given top priority. Guides for automotive, dental assisting, health occupations, and welding will be developed. Trade tests for measuring success are to go with the guides.

Home economics will complete a curriculum for homemaking to be presented at the annual conference. The curriculum guide includes the sequence program in home economics at the high school level with suggested content for semester courses of varing types.

Distributive Education is developing curriculums at post secondary level in sales-marketing, petroleum service, and banking services; at secondary level in economics of distribution, advertising and marketing; and at adult level in advertising, store buyer, general selling procedures, methods of detecting shoplifters, and display methods and techniques.

Business education is developing business office education manual of operation, adult-technical program guidelines, overall technical education planning and in service guidelines.

Agriculture will add an assistant supervisor to the instructional materials laboratory at Ohio State University.

All of the services have increased the budget for instructional material laboratories. See Exhibit E, Proposed Increases in Teacher Training and Supervision Budget Over 1965-66.

e. Research, Experimental and Developmental

Business education is experimenting with Cleveland in a project developing large size introductory typing classes, with Bucyrus in a disadvantaged youth clerical program in a rural setting similar to the successful one operated in Cincinnati-City setting, and four drive-in conferences with nationally known specialists to bring some new features to all Business Office Education teachers in Ohio.

Agriculture committees will further define the biological principles approach in teaching vocational agriculture, will develop procedures in the use of economic principals in teaching farm management, and consider the development of a program to identify physical principles which can be used in teaching vocational agriculture.

Trade and industrial education is working with several cities in developing and studying programs for pupils of limited ability. Dayton is one of the cities requesting a grant through United States Office Education to evaluate their program. Assistance has been given by trade and industrial services and the Ohio Research Coordinating Unit.

The Ohio Research Coordinating Unit will stimulate, coordinate, facilitate and disseminate research and information.

f. Evaluation of Programs and Activities

Vocational Home Economics will work with teacher education and teachers in developing techniques to use in evaluating local curriculum in vocational home economics. This committee will study the ways home economics for homemaking has contributed to the improvement of families as well as to the economy of the nation. Evaluation devices will also be developed to measure the outcomes of the job training program in vocational home economics. A teacher educator at Weselyan University will give full time to evaluation.

Trade and industrial education will study the team approach for evaluation of programs at the local level. The purpose is to evaluate programs in terms of soundness and breadth of offering possible in the local system. It is expected that this method will encourage programs to expand to offer vocational instruction at all levels.

Agriculture will study the effectiveness of the use of biological principles in teaching, the effect and value of the farm business and analysis program, as far as farm people are concerned, the effectiveness of technical school programs and the procedures in some areas where the patterns of instruction have been varied in the pilot programs.

Business education activities includes: A workshop at Toledo University in June, 1966, developed a guideline for evaluation procedures in the stenographic program. Publication of this document for dissemination to all Ohio programs for self-evaluation purposes and experimental useage will be made. A planned session to develop a pattern of testing in cooperation with the Ohio State Employment Service will be inaugurated. Achievement and analysis

testing will also be developed in cooperation with the State Guidance and Testing Division, Testing Program Service for evaluative purpose.

The research coordination unit will direct attention toward the evaluation of the State Division of Vocational Education activities and services, the establishment of a pattern of evaluation of local existing programs and activities and procedures for evaluating local programs and activities in preparation for the congressional evaluation to be made in 1967.

INTRODUCTION

The Manpower Development and Training Act became effective in Ohio on September 1, 1962, upon the signing of an agreement by the affected agencies on the Federal and State levels. The purpose of this Act is to establish publicly-sponsored worker training programs to reduce unemployment and alleviate shortages in vital occupational categories. It is recognized that a number of employment opportunities exist during periods of substantial unemployment, but certain jobs remain unfilled because of a lack of qualified, experienced applicants.

Prior to the enactment of the Manpower Development and Training Act, the Ohio Legislature passed the Ohio Worker Training Act, effective October 11, 1961.

The Manpower Development and Training Act requires evidence that a need exists for a particular occupation before training in that occupation is approved. Such need may be determined by means of an occupational survey of the local labor market area. Upon the recommendation of the Toledo Manpower Advisory Committee, the Manpower Development Section of the Ohio Bureau of Unemployment Compensation agreed to undertake such a survey. The findings of this occupational survey are presented in this report.

When the survey was under consideration by the Manpower Advisory Committee the question of the area to be covered was discussed. It has been the general procedure when making such surveys that the Standard Metropolitan Statistical Area be the determining factor. In this case, however, it was decided that several factors made it desirable to restrict the sample to the confines of Lucas County. The large percentage of response and the fact that all large employers were included in the sample would permit the expansion of the published results by the following percentages in order to give area wide estimates: Total 18.2 percent; Manufacturing 21.7 percent; Construction 4.7 percent; Transportation and Utilities 10.3 percent; Wholesale and Retail Trade 16.1 percent; Finance and Insurance 7.7 percent; Service 10.3 percent; and Government 31.4 percent.

Only Lucas County, which is a part of the Toledo Standard Metropolitan Statistical Area including Wood County, Ohio and Monroe County, Michigan, is covered in this report.

46

HIGHLIGHTS

. . . The Manpower situation in Toledo has taken a new turn. Employers forecast a 1 year increase of 3.5 percent more jobs and a 2 year increase of 6.1 percent in employment.

. . . The 165 occupations studied here represent 82 percent of the total employment in Lucas County. Manufacturing provides the most jobs — 36 percent — Wholesale and Retail Trade is next with 22 percent.

. . . Job hunters will find 14,424 openings during the 12 months following the start of this survey in April 1965 — in 24 months 19,447 openings — just in the 165 occupations.

7,177 persons will be needed for expansion in twelve months
7,247 persons will be needed for replacement in twelve months
10,034 persons will be needed for expansion in twenty four months
9,413 persons will be needed for replacement in twenty four months

. . . Around 70 percent of the jobs are held by men and 30 percent by women. An increase in the proportion of females in recent years.

. . . Of the 165 occupations 54 show significant need — 39 will offer little or no chance for employment. Openings will develop in all fields but skilled and clerical workers will find the most opportunities.

. . . Occupations showing principal demand are:

Accountant	Bus Driver	Electric Motor Repairman
Asbestos Worker	Cashier	Electrician
Assembler	Central Office Repairman	Engineer
Auto Body Repairman	Checker	Foreman
Auto Mechanic	Clerk, General Office	Inspector
Auto Service Station Attendant	Clerk Typist	Insurance Salesman
Beauty Operator	Coil Assembler	Janitor/Maid
Bartender/Barmaid	Cook	Laboratory Technician
Bookkeeper	Draftsman	Laborer

This study is limited to 165 of the major occupations. Actually this represents many more due to combining may be critical if trained workers are not available.

. . . Gross needs in nonmanufacturing are almost double those in manufacturing — replacement needs are somewhat larger than expansion needs.

. . . There is a significant amount of commuting in and out of Lucas County with a net gain of 9.324 to the total work force.

. . . Recent technological developments will necessitate more scientific, engineering personnel, and supporting technicians and craftsmen. Future outlook is for rapid changes and steadily increasing complexity of the content of many professional, technical and skilled occupations.

. . . Demand will exceed the supply. Many of those presently counted as unemployed are either job attached or are not trained for today's skills.

. . . School dropouts and people with no marketable skill will find it increasingly hard to find employment.

. . . The spotlight of this survey is on Manpower Resources and Skill development. Continued economic growth requires an intensification of employment opportunities and a work force capable of producing more goods and services. Failure to utilize the unwanted, unskilled and untrained manpower could be disastrous.

Machine Operator	Policeman/Guard	Stock Clerk
Machinist	Power Press Operator	Teacher
Maintenance Man	Pressman Printing	Telephone Operator
Maintenance Mechanic	Roofer	Tool and Die Maker
Managers	Salesman General	Truck Driver
Molder	Salesperson Retail	Upholsterer
Nurse LPN	Secretary	Waiter/Waitress
Nurse RN	Sewing Machine Operator	Warehouseman
Plumber/Pipefitter	Sheetmetal Worker	Welder

those having similar characteristics but different job titles. Others with too few workers to be included

SUPPLY AND DEMAND SITUATION

DEMAND

Lucas County employers, reporting on their anticipated growth, forecast an increase of 3.5 percent in 12 months and 6.1 percent increase in 24 months. From a base of 163,100 persons employed as of April, 1965 they anticipate that by April, 1966, 168,809 will be employed and 12 months later 173,014 will be employed. This is a change of 5,709 in one year and 9,914 in two years. As a measure of the expansion shown here, the growth in population from 1950 to 1960 was 14.9 percent, or approximately 1.5 percent increase per year. In the statistical abstract of the State of Ohio it is estimated that there will be a 26.1 percent increase statewide in population from 1960 to 1970, or approximately 2.6 percent per year. From this it will be seen that employers expect a more rapid rate of increase in employment in the Lucas County area than the expected rate of population growth. Note: The industrial forecast of 5,709 and 9,914 new jobs in twelve and twenty-four months here, is smaller than the expansion needs of the 165 occupations due to the shifting of occupations within the industries.

There was a total of 912 current vacancies indicated by the employers responding to the survey. Many correspond to the jobs which have been indicated as shortage occupations. While not all employers respond to the part of the questionnaire which asks for job vacancies because of a reluctance to reveal such information it also should be considered that in many cases the employer would only hire on a very selective basis. Many of the vacancies indicated on the survey form also had a check in the following column showing that they were hard to fill occupations. The demand by employers engaged in Manufacturing shows an increase from the present employment of 58,700 to 61,020 in one year and 62,698 in two years. This would result in 2,324 jobs in 12 months which is a 4 percent increase and 3,998 in 24 months, an increase of 6.8 percent. In Nonmanufacturing the present employment is 104,400 which after a 3.2 percent increase in 12 months will amount to 107,789 and in a 5.7 percent growth in 24 months to a total figure of 110,316. Numerically the largest increase will be in Wholesale and Retail Trades where 1,317 more persons will be needed in 1 year and 2,283 in two years which is a 3.7 and 6.4 percent increase respectively. Percentage wise the largest increase is in Construction where employers forecast a 7.4 percent increase in one year and a 11.5 percent increase in two years however this would result in 559 in new jobs in 12 months 872 in 24 months. Significant gains will be made in Services in which 25,200 people are presently employed with a 3.6 percent increase in one year and 5.8 percent increase in two years resulting in 906 and 1,467 more jobs in the one and two year periods. Similar gains are predicted in other areas of Nonmanufacturing employment. So far only the step up in total employment has been discussed; however, it should be mentioned that a large number of people will be needed for replacement purposes for those leaving the labor force due to death, retirement, entering the armed forces or for a variety of other reasons. Information on replacement needs is available only in the 165 occupations studied; however, further demands of 14,424 in 12 months and 19,447 in 24 months should be added to the expansion needs. It is believed that replacement needs tend to be conservative, especially from smaller employers.

SUPPLY

For the base period of April 1965, a total of 6,433 were registered with Employment Service Offices in the Lucas County area. Of these 2,307 were males, and 4,126 were females. (See Table IX) This could be regarded as being an available supply of workers, although it should be pointed out here that many of these people may be temporarily laid off and should be considered as being job attached. That is, pending recall they would not accept employment with another firm. Due to the fact that many others are not sufficiently well trained or that they are trained in different occupations and would not be interested in other types of work, many may not be available for the jobs employers anticipate will be opening. Other than those presently out of work, the other source of labor supply come from those migrating into the county from other areas which during the past ten years has amounted to an average annual increase of about one percent. The total high school enrollment was 23,119 in 1960 or about 6,000 in each class. This does not mean the full 6,000 would immediately enter the labor market on graduation. A number of the females do not enter the labor force. Those graduates going on to College would not immediately enter the labor force; again, others would defer entering the labor force for a variety of reasons. Students graduating from nearby colleges can not be assumed as an available work force for the Lucas County area because many of them will accept employment in other places. The measure of the future trained work forces can not wholly be determined by the number of people presently unemployed, plus those who will be entering labor force by way of schools, and those who are receiving other kinds of training. The quality of the work force, however, will depend a great deal on the type of training those newly entering the labor market will receive or upon those who will have to be retrained in order to retain their position as a member of the labor force.

EXPANSION NEEDS

In this survey 134,482 wage and salary workers were found to be employed in 165 occupations. This is around 82 percent of the Nonagriculture work force. In the 165 occupations a total of 7,117 will be needed for expansion purposes in the next 12 months to fill new jobs developing. In 24 months, 10,034 will be needed. (See Tables V and VIII for listing of jobs.) During the first year covered by this survey, Manufacturing employment will increase by 2,545 due to expansion, while Nonmanufacturing employment will be increased by 4,632. The largest single gain under Nonmanufacturing will be in Wholesale and Retail Trades, where 2,212 will be needed by the end of the first year. In Services 1,122 and in Government 1,006 more persons will be employed. While proportionately the increase in the other four industrial groups is significant, the actual number of persons involved is considerably less than in Wholesale and Retail Trade, Government and Services. By the second year Manufacturing employment will have grown by 3,777 and Nonmanufacturing by 6,257.

By occupational group the skilled and semiskilled employment will increase by approximately equal amounts with 1,422 more needed in skilled jobs and 1,419 in semiskilled for expansion purposes. An estimated 1,102 more unskilled workers will be needed while clerical employment will increase by 932 and sales employment by 957. Professional and managerial employment and services will increase by 690 and 655 respectively. The rate of expansion in 24 months will not be quite as great as that forecast in the first year by employers; however, 10,034 new workers will find jobs which did not exist at the time the survey was made. About the same ratio of demand among the occupational groups exists in the 24 month need as with the 12 month need with skilled needs amounting to 2,079 and semiskilled to 1,831.

SHORTAGE OCCUPATIONS - Expansion

Accountant, asbestos worker, assembler, auto body repairman, auto service station attendant, bookkeeper, bus driver, cashier, central office repairman, clerk general office, clerk typist, coil assembler, cook, draftsman, electric motor repairman, electrician, engineer, inspector, insurance salesman, janitor/maid, laboratory technician, machine operator, machinist/job setter, manager/official, molder, registered nurse, policeman/guard, power press operator, salesman general, salesperson retail, sewing machine operator, sheet metal worker, stock clerk, teacher, tool and die maker, truck driver, waiter/waitress and warehouseman.

REPLACEMENT NEEDS

New entrants to the labor market or persons seeking employment need not depend entirely on the expansion of industry in order to find jobs. As shown in the chart on page 19 the majority of the work force are younger workers. Therefore as people leave the labor force they have to be replaced in order to keep the wheels turning. Half of the 19,447 jobs which will be opening up by the end of the 24 months in this area will be due to replacement needs. This is distinct from turnover where people leave one employer in the same area to take a job with another. A total of 7,247 will be needed in 12 months and 9,413 in 24 months for replacement purposes. This is at a rate of about 5.4 percent the first year for replacement needs. Employers engaged in Manufacturing employment dominate the picture numerically therefore the number of persons needed for replacement here is larger than those for other industry groups. A total of 2,078 in one year and 2,790 in two years will be needed. In the Nonmanufacturing segment, replacement needs in Wholesale and Retail Trade are considerably higher than that in other groups, however, Service and Government needs are somewhat higher than those in the other groups.

While governmental establishments do not expect much expansion, they did forecast a relatively high replacement need. In the occupational groups, for replacement needs, the job openings will be most plentiful in clerical occupations followed closely by skilled, professional and managerial, and unskilled occupations in the 12 month period. At the end of 24 months the number of clerical workers needed will remain relatively high. The replacement needs for both periods of sales personnel is relatively low as compared to that forecast for other occupations.

SHORTAGE OCCUPATIONS - Replacement

Shortage occupations for replacement include: assembler, auto mechanic, auto service station attendant, barber/beauty operator, bookkeeper, cashier, checker, clerk general office, clerk typist, cook, draftsman, engineer, foreman, insurance salesman, janitor/maid, laboratory technician, machine operator, machinist/job setter, maintenance mechanic, manager/official, molder, nurse aide, nurse LPN, nurse RN, plumber/pipefitter, policeman/guard, pressman, printing, routeman, salesman general, sales person retail, secretary, sewing machine operator, stenographer, stock clerk, teacher, telephone operator, truck driver, upholsterer, waiter/waitress, warehouseman.

CURRENT FEMALE EMPLOYMENT

The number and importance of women in the nations work force has been increasing steadily in recent years. Today approximately one third of the employment in this country is made up of women. Working females in the 165 occupations surveyed in Lucas County numbered 41,038, 30.5 percent which is slightly less than the ratio of employment in the United States

Among the industrial groups the proportion of female workers to male workers in Lucas County varies considerably. In manufacturing establishments throughout the county only 18.7 percent of the workers are women. The largest proportion of women are found in Finance and Insurance where over half, 55.3 percent, are females, followed closely by Services in which 48.7 percent are women. The smallest percentage (6.1 percent) is in Construction.

Because of the variation in the number employed among the industrial groups the proportion of females compared to males does not serve as a guide in studying the distribution of working women between the groups. About one third of all employed women are in Wholesale and Retail Trade while 23.4 percent are in Manufacturing. Only 1.1 percent are in Construction. Usually in governmental establishments the number of women is higher in relation to the total female employment than the 14.5 percent found in Lucas County.

In the occupational groups the proportion of females in relation to males shows even more variation than by Industrial groups. A very small number of the females are found in skilled and unskilled jobs while 55 percent of the total are divided about evenly among Sales, Professional, Services and Semiskilled. Clerical workers account for the balance, 38.7 percent.

In clerical jobs the male - female proportion leans strongly on the female side with 66.2 percent being women. Another occupation group with a high percentage of women is Services in which about half are females. Sales and Professional occupations each have about one third women while in semiskilled jobs about one fifth of the workers are females. Very few are found in skilled occupations.

Referring to the chart on page 19, it is shown that girls in the 14-19 year age group tend to work for wages in a larger proportion than among the males of the same age group with about 4,500 females employed. After high school many more go to work for a few years to bring the total up to above 6,000 in the 20 to 24 age group. Then there is a sharp reduction in those working in the 25 - 29 year age group. Employment among females then begins to climb back gradually to a peak consisting of those aged 40 to 44 years. From then on the curve follows somewhat that of the male workers in that there is a gradual decline in the number of those in each of the succeeding age groups at first then accellerating from 60 on. While the curve in the 1950 census does not recover to the peak reached in the 20 to 24 group of 1960 there is again a sharp decline after the initial climb.

Occupations in which female workers were employed in a high proportion of the jobs and in which employment opportunities would be the largest are: assembler, beauty operator, bartender/barmaid, bookkeeper, cashier, checker, clerk general office, clerk typist, coil assembler, cook, dietary worker, foreman, inspector, insurance sales, janitor/maid, laboratory technician, laborer, machine operator, manager, nurse aide, nurse LPN, nurse RN, press operator, sales person, secretary, sewing machine operator, stenographer, stock clerk, seamstress, teacher, telephone operator, and waitress.

. . . Manufacturing in Lucas County accounts for approximately 36 percent of the 163,100 nonagricultural wage and salary workers. There were 113 occupations studied in manufacturing establishments with 51,334 persons employed. About one third of the workers in factories are semiskilled and about one fourth skilled workers with 17 percent falling into the unskilled category and 12 percent clerical workers. Little less than 10 percent are classed as professional or managerial employees and only a small percentage in sales and services. Expansion needs exceeds replacement needs with the 12 month demand for expansion being 2,545 and the replacement needs 2,078 making a gross need of 4,623 in 12 months. For the 24 month period the gross need is 6,567 of which 3,777 are for expansion purposes and 2,794 are for replacement. About a third of the total demand is for semiskilled occupations with considerable need being shown for skilled and unskilled categories. A moderate demand is shown for clerical and professional or managerial workers and only a relatively small demand for sales personnel. Probably the outstanding item in this category is the expansion needs for semiskilled workers. The occupations in which the largest demand is reported by employers are: assembler, auto body repairman, clerk general office, coil assembler, draftsman, electrician, engineer, inspector, laboratory technician, machine operator, machinist and job setter, maintenance mechanic, manager/official, molder, power press operator, pressman - printing and publishing, routeman, salesman general, secretary, sewing machine operator, sheet metal worker, tool and die maker, and welder. (See Table VIII).

CONSTRUCTION

PROJECTED REQUIREMENTS IN 41 OCCUPATIONS
NEEDS FOR 12 AND 24 MONTHS
LUCAS COUNTY
1966 - 1967

. . . Total employment in Contract Construction amounts to a little less than 5 percent of the total of the work force of Lucas County. Employers in the Construction business anticipate a higher rate of expansion than is found in most of the other industrial groups. A total of 508 of new employees will be hired by the end of the first year and 643 by the end of the second year for expansion purposes in Contract Construction. This along with the 409 in one year and 434 in two years for replacement needs makes a gross need of 917 in 12 months and 1,077 in 24 months. Over half (65 percent) of those employed in Construction are skilled workers. While 21 percent are unskilled; the balance make up about one fourth of the total employment. Because the bulk are skilled workers the largest demand ;is for skilled craftsmen with 201 needed in 1 year and 488 in two years. The only other need of any significance is among the unskilled where 385 are needed. Out of the 41 occupations found in Contract Construction there are 5 in which a demand of significance was shown. These are: bricklayer/mason, electrician, laborer, plumber/pipefitter, and truck driver.

TRANSPORTATION AND UTILITIES

. . . Fifth in size in the number of people employed Transportation and Utilities has 7.8 percent of the total employment in Lucas County. There were 65 occupations out of the 165 surveyed with an employment of 8,541 out of the total employment of 12,900 with 60 percent of the employment divided about evenly between clerical and skilled occupations. Another 21 percent is employed in the semiskilled occupations with about half that number being unskilled workers. The other 10 percent is found in the three remaining occupation groups. A total of 792 of the jobs will open up in the first year, 453 being for replacement purposes and 339 for expansion needs. By the end of 24 months a total of 1,062 will be needed with 554 for replacement and 508 for expansion. While there is considerable growth shown in the expansion needs in the skilled occupations the volume of the demand for the clerical occupations is in the replacement needs. There were 6 occupations in which significant demands appear. They are: bus driver, central office repairman, clerk general office telephone operator, truck driver and warehouseman.

TRADES

PROJECTED REQUIREMENTS IN 68 OCCUPATIONS

NEEDS FOR 12 AND 24 MONTHS
LUCAS COUNTY
1966-1967

68 SELECTED OCCUPATIONS	CURRENT EMPLOYMENT		12 MONTH NEED			24 MONTH NEED		
	TOTAL	FEMALE	REPLACEMENT	EXPANSION	GROSS	REPLACEMENT	EXPANSION	GROSS

. . . Employment in Wholesale and Retail Trade accounts for 35,500 jobs in Lucas County. In 68 occupations identified in Wholesale and Retail Trade, a total of 33,660 persons were employed. Employers forecast a 3.7 percent increase in one year and a 6.4 percent increase in the overall employment in two years. As might be expected about one half of the total employment is in the clerical and sales type of occupations with 20 percent being found in clerical and 29 percent in sales. Service type occupations make up 19 percent, 10 percent are skilled workers with the remaining 20 percent being found in the other categories. While the replacement needs in Services are considerably larger than the expansion needs, the reverse is true in clerical and sales type of occupations. A relatively large demand is shown for skilled workers in comparison to the total number employed. A total in all occupations of 4,170 will be needed in one year and 5,414 in two years. The occupations in which the largest demand is shown are: auto body repairman, auto mechanic, auto service station attendant, bartender/barmaid, cashier, checker, clerk general office, clerk typist, cook, laborer, manager/official salesman general, salesperson retail, stock clerk, upholsterer, waiter/waitress and warehouseman. (See Table VIII)

GOVERNMENT

PROJECTED REQUIREMENTS IN 68 OCCUPATIONS

. . . The persons employed by governmental agencies in Lucas County as of April, 1965 numbered 17,200. A total of 68 occupations are reported here in which a total of 15,724 are employed. Nationally 17.1 percent of the total is accounted for by those working in public employment while in the State of Ohio the percentage is 14.1. In Lucas County however it is only 10.5 percent. The largest single group of people in government work are professional and managerial employees with 6,683 so employed making up 43 percent of the total. Of these by far the largest number are engaged in the teaching profession around one fourth are found in service types of occupation and 16 percent are found in clerical work. The balance are found in skilled, semiskilled and unskilled work. Because of the fact that the largest number of persons in governmental establishments are professional and managerial employees the largest demand will also be found in this area with 1098 needed in 24 months and 921 in 12 months. A large part of this is replacement needs with 741 needed for replacement and 180 for expansion in 12 months, 762 for replacement and 336 for expansion in 24 months. This accounts for a large part of the total need which amounts to 1,006 for replacement and 365 for expansion in one year. For the second year the replacement need will be 1,106 and the expansion need 616 in 2 years. Teachers, policeman/guard, and nurses are the principal occupations in which considerable demand is shown however there are a number of other occupations which show need. (See Table VIII)

SERVICES

PROJECTED REQUIREMENTS IN 77 OCCUPATIONS

NEEDS FOR 12 AND 24 MONTHS
LUCAS COUNTY
1966 - 1967

77 SELECTED OCCUPATIONS	CURRENT EMPLOYMENT		12 MONTH NEED			24 MONTH NEED		
	TOTAL	FEMALE	REPLACEMENT	EXPANSION	GROSS	REPLACEMENT	EXPANSION	GROSS

. . .This survey identifies 77 occupations in the service industry with a total of 12,191 persons employed. Employers forecast a 3.6 percent increase in employment in 12 months and a 5.8 percent increase in 24 months in the overall employment. Since this survey is concerned with nonagricultural wage and salary employment and a considerable number of people in services are self employed or are in nonprofit organizations the number identified in the 77 occupations studied is only approximately one half of the total estimated employment in Services. It was found in the occupations examined that a total of 2,078 persons would find employment by the end of the 12 month period and 2,744 at the end of the 24 month period. There will be 1,122 needed for replacement and 956 for expansion in 12 months and 1,512 for replacement 1,232 for expansion in 24 months. The largest occupational group in Services are those engaged in jobs classified as professional or managerial where 27 percent of the total are so employed. The strictly service type occupations employed 23 percent of the total while clerical occupations provided work for 21 percent. Other than the 30 percent divided among the remaining occupation groups 11 percent are unskilled workers. The largest demand is in professional managerial and service type occupations. About 16 percent of the total employment in Lucas County is in Services which is slightly higher than the state average of 13 percent or the national average which is 14 percent. The principal occupations for which a demand is shown are: cashier, clerk general office, clerk typist, draftsman, electric motor repairman, electronics mechanic, engineers, janitor/maids, laborers, laundress/laundryman, nurse aide/orderly, nurse licensed practical, nurse registered, policeman/guard, salesman general, sheet metal worker, stenographer, waitress. (See Table VIII)

FINANCE

PROJECTED REQUIREMENTS IN 32 OCCUPATIONS

NEEDS FOR 12 AND 24 MONTHS
LUCAS COUNTY
1966-1967

32 SELECTED OCCUPATIONS	CURRENT EMPLOYMENT		12 MONTH NEED			24 MONTH NEED		
	TOTAL	FEMALE	REPLACEMENT	EXPANSION	GROSS	REPLACEMENT	EXPANSION	GROSS

UNSKILLED	139	30	—	—	—	—	—	—

. . . The smallest employment in terms of numbers is Finance, Insurance and Real Estate with only 3.7 percent of the total in Lucas County being found in such endeavor. This is somewhat lower than the average found in both United States and Ohio. The total employment in this category for Lucas County amounted to around 6,000 persons with 5,665 being found in the 33 surveyed occupations. Over half (54 percent) of the employment here is in the clerical field. Although only 22 percent of the total employment is in sales the 12 and 24 month demand calls for 269 and 435 respectively for replacement and expansion needs. In clerical occupations the total demand is for 163 in 12 months and 344 in 24 months. The balance of the demand is relatively small so that by the end of 12 months only 221 will be needed for replacement, 252 for expansion or a total of 473. For the 24 month period 351 will be needed for replacement, 510 for expansion for a total of 861. The principal occupations in which a demand will be shown are for clerk typist, and insurance salesman.

(See Table VIII)

POPULATION AND WORK FORCE

Certain data not covered by this survey but pertinent to a study of the labor force are found in Census Reports. Population growth is not necessarily correlated with labor force growth. Shifts in places of residence and industry growth on the fringe areas have resulted in changed patterns of employment. Standard Metropolitan Statistical Areas have been enlarged. Comparability of data is difficult to achieve. For instance, Census data is gathered from the individual person while most labor data is gathered from the employer and from tax records. The following is information only in relation to figures presented in the survey and cannot be considered as comparable. At the time the Census was taken the SMSA consisted of Lucas County, the same area covered by this survey.

The population of Lucas County grew from 344,333 persons in 1940 to 395,551 in 1950 which was a 14.9 percent increase. The rate was a little higher from 1950 to 1960 when the population reached 456,931 at a 1.55 percent increase per year for the ten year period. During the year live births numbered 10,664 while deaths numbered 4,649 - a net increase of 6,015, and a 1.1 percent increase due to natural growth. The net gain due to migration was only 136 persons from 1950 to 1960.

The 1950 Census reported a civilian work force of 168,872 while in 1960 the work force was reported at 179,580. The rate of change of employment in those jobs covered by Unemployment Compensation for a similar period 1950 to 1960 was from 127,115 to 125,863 workers or a 9.1 percent decrease. The decrease in covered employment was not a uniform rate in all industry groups. Construction decreased by 345 workers from 7,307; Manufacturing decreased by 6,434 from 66,711; Transportation & Utilities increased by 1,188 to 7,969; Wholesale and Retail Trade increased 974 to 33,752; Finance and Insurance increased 1,395 to 5,085 and Service grew by 1,907 to 11,385. The total covered employment in all industries was back up to 126,303 in 1964.

From this it will be seen that the proportion of the work force in relation to the population has been decreasing. One obvious reason is the increased number of persons in school. This is offset somewhat by the increase in the number of females employed which jumped from 28 percent to 33 percent. Other factors are at work in both directions but resulting in a smaller proportion in the work force.

Another important influence on the number of people employed in any locality is the commuting pattern. The effect here is somewhat different than that found in most counties and influenced the change in the metropolitan area definition now in use which includes both Wood County in Ohio and Monroe County in Michigan. It is reported that 9,014 persons living in the county work outside the county — a little over half in Wood County. On the other hand, 18,338 persons live outside the county and work in the county — around 6,000 each from Wood County and Monroe County. Incidentally, almost all travel by auto. This is a net gain of 9,324 persons to the work force.

School enrollment in 1960 was 110,273 -- 24.1 percent of the population -- another 11.6 percent are children under 5 years, 35.7 percent either in school or too young, over a third of the population. The work force with 39.3 percent and youngsters with 35.7 percent make up exactly three fourths of the population. The balance is nonworking females and retired persons.

While 11.6 percent are children under 5 years of age, 61.3 percent are persons 21 years and older. Those 65 and over make up 9.8 percent of the population. The median age is 31.1 slightly above the state average of 29.5 years. The age at which people enter the work force varies and there is a variation between men and women. Such things as baby booms also effect the age of the work force as well as retirement policies and hiring practices. The accompanying chart shows the various age groups, by sex, of the work force in Lucas County as of April 1960. Published data for 1950 are not exactly comparable however the peak is in the 25-29 year age group among the males. It is again difficult to compare female employment of 1950 with 1960 due to the growth in total number employed.

EMPLOYMENT STATUS BY AGE AND SEX

In 49.5 percent of the total number of families the head of the family is the only person in the work force. In 25.1 percent of the families both the head of the family and the wife are both employed. Similarly 33.9 percent of all families have only one member working; 30.5 percent have two members working; 6.9 percent have three or more members working; and 8.7 percent of families have no one working. In about half of the cases where the head of the family and the wife are both employed there are one or more children under 18.

RECOMMENDATIONS

In Lucas County, as well as in other areas throughout the country, the new dimension in the labor force is QUALITY, rather than quantity. If we are to maintain a high rate of economic growth, we must make a conscious effort to assure further development of our manpower resources and their more effective utilization.

To achieve an adequate, skilled and versatile work force, the Manpower Advisory Committee for the Lucas County area recommends the following:

ACTION FOR AREA LEADERS

Business and labor organizations in Lucas County and other community organizations must assume the responsibility of providing a planned program for improving the skills of the work force. They should disseminate the results of this survey to all persons and organizations interested in the development of our resources, particularly to employers, educators, vocational counselors, labor representatives, and Parent Teacher Associations.

Promote equal opportunities for all qualified individuals to acquire skills.

Strengthen the contributions of secondary schools, universities and colleges, and community colleges to assist workers in the acquisition of skills.

Urge employers and labor unions to accelerate and improve on-the-job, apprenticeship and other types of training programs.

Attract new industry into the area which can utilize the present and future work force of the county.

ACTION FOR EMPLOYERS

It will require an all out effort on the part of business and industrial leaders to train and develop skilled workers and relieve the growing unemployment among unskilled work groups.

Strengthen communication between the business community and school authorities in the development of new curriculum requirements resulting from technological changes.

Encourage full utilization and expansion of technical, apprenticeship and vocational training programs or develop needed programs where they do not exist. Strengthen and develop more effective cooperative work training programs between employers and schools. Participate in on-the-job training programs with the Bureau of Apprenticeship and Training under the Manpower Development and Training Act of 1962.

ACTION FOR EDUCATION

Key responsibility for developing "workers acceptable to employers" rests with the schools and training agencies.

1. Educate students and parents that "any honest, productive work with the hands is rewarding, both financially and socially, and that a job well done brings to the worker both prestige and dignity".

2. Develop more effective programs for vocational guidance, and improve counseling and placement programs.

3. Work with local employers in setting up and improving work study and vocational education programs.

4. Expand adult education under the Manpower Development and Training Act to upgrade workers skill in shortage occupations.

5. Expand programs for providing vocational and industrial training facilities and curricula with the same diligence and emphasis which has traditionally been placed on college preparatory programs.

METHODOLOGY

This study was conducted in general accord with the method recommended and outlined by the Federal Bureau of Employment Security in its Handbook on Labor Market Research Methods (Draft Section No. 5).

Information on all job titles of reporting firms was requested. Occupations totaling less than ten for the county, after applying the industrial inflation factor, were deleted leaving 165 identifiable occupations for study.

A list of firms covered by the Ohio Unemployment Compensation Law was used to group firms in the industries selected for survey into three size categories of 1-9, 10-99, and 100 or more employees. Because of the great variation in the number of firms in the two smaller size groups, from industry to industry, it was impractical to establish a set sample to the universe ratio that would be applicable to all industries. It was necessary to handle each industry individually in selecting a sample of smaller firms that would attain the desired reliability.

There were approximately 5005 covered employers in Lucas County. A total of 831 firms were included in the sample which represented 65 percent of the covered employment in the county. Major non-covered employers (government, hospitals, schools, etc.) were also included. Because of the inclusion of all employers with 100 or more employees, and their 85.7 percent response, 79.7 percent of all the employed workers in the sample were reported.

After checking the returned reports for accuracy, the total employment reported by the surveyed firms was then expanded by industry to equal the total April 1965 employment in each industry. The expansion factors were then applied by industry, to the broad and specific occupational categories, replacement data and the projected employment totals for twelve and twenty-four months to arrive at industry totals for this information. Data processing equipment was used in computing this information and much of the statistical material shown in tabular and graphic form in this report.

FOR THE PURPOSE OF THIS SURVEY THE FOLLOWING ASSUMPTIONS WERE MADE AS A GUIDE TO RESPONDING FIRMS:

1. The present long term trend of economic growth of the United States will continue with no major setback for the next few years.

2. Scientific and technological advances will continue, affecting our industrial production, methods, manpower requirements and consumption patterns.

TABLE X
APPLICANTS SEEKING JOBS IN THE SELECTED OCCUPATIONS
LUCAS COUNTY - April 1965

There were approximately 6,433 job applications in the active files of the Toledo Office of the Ohio State Employment Service. These were examined to determine the characteristics of applicants in the selected occupations. Although all are generally qualified on their application when counted, they may not specifically meet the employer's needs.

DEFINITIONS OF OCCUPATIONAL GROUPS

1. PROFESSIONAL AND MANAGERIAL - This group includes occupations that predominantly require a high degree of mental activity by the worker and are concerned with theoretical or practical aspects of complex fields of human endeavor. Such occupations require for the proper performance of the work either extensive and comprehensive academic study, or experience of such scope and character as to provide an equivalent background, or a combination of such education and experience.

2. CLERICAL AND SALES - This group includes occupations concerned with the preparation, transcribing, transferring, systematizing or preserving of written communications and records in offices, shops, and other places of work where such functions are performed.

   Included in this group are occupations concerned with the sale of commodities, investments, real estate, and services, and occupations that are very closely identified with sales transactions even though they do not involve actual participation in such transactions.

3. SERVICE - Included in this group are occupations concerned with performing services for persons that require predominantly direct contact or close association with the individual. Other occupations in this group are those specifically concerned with the protection or guarding of buildings and other property and of individuals.

4. SKILLED - This group includes craft and manual occupations that require predominantly a thorough and comprehensive knowledge of process involved in the work, the exercise of considerable independent judgment, usually a high degree of manual dexterity, and, in some instances, extensive responsibility for valuable product or equipment. Workers in these occupations usually become qualified by serving apprenticeships or completing extensive training periods. Foremen of manual and craft workers are also included with these occupations.

5. SEMISKILLED - This group includes manual occupations that are characterized by one, or a combination of parts, of the following requirements: The exercise of manipulative ability of a high order, but limited to a fairly well-defined work routine; major reliance, not so much upon the worker's judgment or dexterity, but upon vigilance and alertness, in situations in which lapses in performance would cause extensive damage to product or equipment; and the exercise of independent judgment to meet variables in the work situation, which is not based on wide knowledge of a work field and with the nature and extent of the judgments limited either (a) by application over a relatively narrow task situation or (b) by having important decisions made by others.

6. UNSKILLED - This group includes manual occupations that involve the performance of simple duties that may be learned within a short period of time and that require the exercise of little or no independent judgment.

DEFINITIONS OF INDUSTRIAL DIVISIONS

A brief description of each industrial division follows with examples in each to provide for a better understanding of the data published in this report.

1. MINING AND QUARRYING - This group includes all establishments engaged in mining or quarrying. Mining is here used in the broad sense to include the extraction of minerals occurring naturally. It also includes quarrying, well operations, milling (crushing, screening, etc.) and other preparations needed to render the material marketable.

2. CONTRACT CONSTRUCTION - The term "construction" includes new work, additions, alterations, and repairs. Three broad types of contract construction activity are covered: (a) building construction by general contractors, (b) other construction by general contractors and (c) construction by special trade contractors (specialized construction activities, such as plumbing, painting, electrical work, and carpentry).

3. MANUFACTURING - This group includes establishments engaged in the mechanical or chemical transformation of inorganic or organic substances into new products, and usually described as plants, factories, or mills which used power driven machines and materials handling equipment. The final product of a manufacturing establishment may be finished in the sense that it is ready for utilization or consumption, or it may be semifinished to become a raw material for a plant engaged in further manufacturing.

4. TRANSPORTATION - (Also communication, electric, gas, and sanitary services). This group includes enterprises engaged in passenger and freight transportation by railway, highway, water, or air, or furnishing services related to transportation; petroleum pipe line transportation; warehousing; telephone and telegraph services; radio and T. V. broadcasting; and the supplying of electricity, gas, steam, water, or sanitary services. Most of the establishments included are regulated by commissions and other public authorities as to rates charged, etc.

DEFINITIONS OF INDUSTRIAL DIVISIONS - Continued

5. TRADE, WHOLESALE AND RETAIL - The chief functions of establishments included in wholesale trade are selling goods to retail trading establishments, or to industrial, commercial, institutional and professional users; and bringing buyer and seller together.

   Retail trade establishments engage in selling merchandise for personal, household, or farm consumption, and rendering services incidental to the sale of goods. In general, these establishments are classified by kind of business according to the principal lines of commodities sold.

6. FINANCE, INSURANCE AND REAL ESTATE - Finance includes banks and trust companies, credit agencies other than banks, holding companies, other investment companies, brokers and dealers in securities and commodity contracts, and security and commodity exchanges. Insurance covers all carriers of all types of insurance, and insurance agents and brokers. Real Estate includes owners, lessors, lessees, buyers, sellers, agents, and developers of real estate.

7. SERVICES - This division includes establishments engaged in rendering a wide variety of services to individuals and business establishments; hotels; establishments providing personal, business, repair, and amusement services; medical, legal, engineering, and other professional services; educational institutions; nonprofit membership organizations; other miscellaneous services.

8. GOVERNMENT - Government includes all Local, State and Federal government activities, such as the legislative, judicial, and administrative functions, as well as government owned and operated business enterprises.

JOB DESCRIPTIONS

Accountant	- Devises, installs, controls, examines or supervises accounting operations. Includes cost, budget, general and tax.
Accounting Clerk	- Performs routine posting, calculating and checking of accounts.
Agent (Transportation)	- Ticket, station, and express agents in all types of transportation.
Aircraft Mechanic	- Inspects, overhauls, and services airplanes. Licensed by C.A.A.
Annealer	- Tends an annealing furnace to heat treat metal parts, or may heat parts and quench in oil or water to harden.
Appliance Repairman	- Repairs and installs major appliances in homes or business establishments. Adjusts part or parts and/or replaces defective components and operates appliance to make adjustment.
Appraiser	- Makes appraisals of real property. Interviews persons familiar with property, inspects property, and searches public records of sales, leases, assessments, and other transactions to determine proper value. Compiles material and sets a correct, definite rate.
Asbestos Worker	- Covers with insulating material exposed hot or cold surfaces of equipment.
Assembler	- Fits together or installs complicated mechanical parts or electrical equipment.
Attendant (Animal)	- Feeds and waters birds and animals in a zoo, circus or managerie.
Auto Body Repairman	- Removes dents in automobile bodies and fenders or replaces damaged parts.
Auto Equipment Serviceman	- Adjusts and repairs automotive repair, servicing, and testing equipment.
Auto Mechanic	- Repairs automobiles and trucks, disassembles and overhauls engines, transmissions, clutches, rear ends; grinds valves, adjusts brakes, align wheels.
Auto Service Station Attendant	- Supplies auto or truck with oil, water or gasoline. Sells and installs accessories. Performs minor repairs to autos and trucks.
Baker	- Produces from raw materials finished baked goods such as, breads, cakes and pies.
Barber/Beauty Operator	- Renders any or all services in a barber shop or beauty parlor.
Bartender/Barmaid	- Uses formulas to mix alcoholic beverages, serves same.
Blacksmith	- Forges metal articles and parts into desired shape.
Bookkeeper	- Keeps a complete and systematic set of records of business transactions of establishments.
Bookkeeping Machine Operator	- Places appropriate bookkeeping forms in machine, presses keys for each item, and records total on form.
Box Maker	- A general term used to designate worker who makes boxes.
Bricklayer/Mason	- Lays brick, terra cotta, hollow tile, building blocks, stone and marble, to construct walls, arches, fireplaces, smoke stacks and other structures.
Bus Driver	- Transports passengers from one place to another according to a definite time schedule.

Buyer	- Purchases at the most favorable prices consistent with quality, quantity, and other factors, raw materials, equipment, machinery, and supplies necessary for the operation of a particular organization.
Cabinet Maker	- Performs the hand carpentry necessary to cut, shape and assemble prepared parts of high-grade articles of furniture.
Carpenter	- Performs general carpentry work requiring the skillful use of carpenter's tools.
Caseworker	- Studies physical and social environment of a family, person, or persons in order to determine and execute practical plans for alleviating existing undesirable conditions. Professional.
Cashier	- Collects money for payment of bills and performs work dealing with receiving or initiating bills or makes up bills showing amount due.
Cement Finisher	- Secures a surface of specified texture on floors, walls, or other float-cement surfaces by using trowels, floats, and screens.
Central Office Repairman	- Tests and repairs telephone or telegraph circuits and equipment.
Checker, Merchandise	- Itemizes and totals cost of customers' purchases; receives payments from customers and makes change.
Chemical Operator	- Operates or tends a number of pieces of equipment, performing a number of complex operations to carry out chemical reaction process for a finished product meeting rigid specifications.
Chemist	- Performs analytical and research work of a professional nature in the general field of chemistry.
Clerk, General Office	- Performs any combination of clerical duties. Makes up and files reports, tabulates, and posts records, operates various office machines, etc.
Clerk - Typist	- Performs general clerical work requiring the use of a typewriter. Files records, answers phone and sorts mail.
Coil Assembler	- Solders lead wires to protruding ends of coils and places insulating material around coil so that there will be no shorts between coil and frame of machine or appliance that holds coil.
Commercial Artist	- Creates and designs figures, posters, sign-boards, billboards and showcards. Designs and prepares charts, diagrams, sketches and maps for publication and exhibition.
Compositor/Printer	- Sets type by hand or machine for printing of articles, headings or other printed matter; breaks down and distributes type after use.
Conveyor Man	- Starts, stops and regulates the speed of conveyor systems by operating switchboard, adjusts, lubricates and repairs conveyor systems.
Cook	- Prepares, season and cooks meals or short orders by appropriate methods.
Coremaker	- Makes sand cores of uniform cross sections in a conveyor screw coremaking machine.
Crane Operator/Shovelman	- Operates a crane to hoist and move materials, raise and lower heavy weights and performs other related operations. Operates power shovel.
Cutter Operator	- Cuts continuous sheets of wood pulp in size suitable for processing to nitrocellulose to make plastics.

Decorator	- Plan the selection and arrangement of decorations for homes and other structures to achieve both artistical and functional effect.
Dental Technician	- Prepares patients for examination, treatment, or surgery and assists dentist.
Designer	- A general term applied to a worker who creates or marks out designs for clothes, furniture, machines, or other articles.
Dietary Worker	- Portions food in accordance with diets in a hospital under the direction of a dietitian, also cook helper or kitchen helper in hotel or restaurant.
Dietitian	- Plans menus and special diets for hospital, institution, school, restaurant or hotel. Supervises food service employees.
Dipper	- Operates a machine in which thin rubber articles, such as gloves and nipples are made.
Dispatcher	- Assigns motor vehicles and drivers for conveyance of freight or passengers and maintains records.
Draftsman	- Develops drawing to scale making detailed drawings of parts of machines, products or structures from rough or general design sketches or drawings indicating dimensions, material to be used, and other information necessary to make the detailed drawing clear and complete.
Duplicating Machine Operator	- Operates a machine that prints copies of reading matter, figures, ruled forms, and other data on paper, using any one of several types of machines.
Electric Motor Repairman	- Repairs electric motors, generators, and accessory equipment, such as, starting devices, switches and wiring.
Electrician	- Lays out, assembles, installs and tests electrical fixtures, apparatus, control equipment and wiring.
Electronic Assembler	- Assembles components of electronic equipment.
Electronics Mechanic	- Tests, repairs and adjusts direction finding, computing, radar, television and related electronic equipment.
Employment Interviewer	- Interviews job applicant from viewpoint of an employer to ascertain what work is best suited for his particular abilities. Makes study of employment possibilities, selects applicants he feels best suited.
Engineer	- A general term used to designate persons who meet the educational, experience, or legal qualifications established for the fields of professional engineering.
Engraver	- Engraves lettering or designs on copper or steel plates.
Estimator	- Computes labor, material and equipment installation costs to prepare bids for contractors for construction work or as estimate for customers.
Extruder Operator	- Forms rubber into a tublar, flat or irregularly shaped, continuous strip by machine.
Filling Machine Operator	- Fills sacks or bags, or other containers with loose material, such as flour, sugar, or cement, using a machine that automatically fills the container with the desired weight of the material. Operates an automatic filling machine to fill bottles, caps bottles, may be carbonated beverages, spiritous liquors, or drug products.

Firefighter	- Fights fires and performs emergency rescue work. Rescue work. Rescues persons overcome by fire or smoke and administers first aid to them.
Foreman	- A person who supervises a group of workers.
Furnace Installer & Repairman	- Installs and repairs hot - air furnaces. Replaces defective parts and performs repair duties as required.
Furnace Tender	- Fires and charges an oil or gas fired furnace in which various metals or alloys' are melted to be used in making castings.
Glazier	- Cuts and sets window glass, or glazing of any character using various fastening devices or materials.
Clueman	- Glues together pieces previously cut to specification in assembly of manufacturing articles.
Heat Treater	- Alters the physical and chemical properties of the steel of such parts as dies, cutters, and machine parts, to produce a specified degree of hardness, toughness or strength of an established process of controlled heating and cooling.
Heavy Equipment Operator	- Operates a gasoline or diesel-powered automotive or crawler tread tractor including self-propelled scrapers, graders, rollers, earth movers, etc. May oil, grease, and make minor adjustments and minor repairs to unit.
Housekeeper-Steward	- Supervises the housekeeping personnel and is responsible for the cleanliness, orderliness of the establishment.
Inspector, Machine Shop	- Examines parts or products for flaws or defects and checks dimensions against blue print specifications using precision devices for measuring.
Inspector	- Examines parts or products for flaws or defects and checks dimensions against blue prints specifications using precision devices for measuring.
Instrument Repairman	- Installs, repairs, and adjusts instruments and gages.
Insurance Salesman	- Sells various types of insurance to new clients. (life, fire and marine).
Janitor/Maid	- Keeps public parts of buildings in clean, orderly condition and good state of repair.
Key Punch Operator	- Records accounting and statistical data on tabulating cards by punching a series of holes in the cards in a specified sequence, using a punch machine similar to a typewriter.
Laboratory Technician	- Performs routine tests following established procedures using standard equipment and maintains necessary records.
Laborer	- An occupational grouping including a number of jobs of a lesser skill which are peculiar to certain industries where extensive training is not involved.
Laundress-Laundryman	- Performs all laundering duties, such as washing, drying and ironing.
Lineman/Serviceman	- Installs, maintains and repairs telephone, telegraph or power wires or cables.
Linoleum Layer	- Applies blocks or strips of shock absorbing, sound deadening, decorative floor covering.

Machine Operator	- A general term used to designate any worker who operates machines to change shape or condition of raw materials, usually semiskilled or lower level occupation.
Machine Tool Operator	- Operator of any of the various machine tools including engine lathes, milling machines, turret lathes, radial drill presses, boring mills, shapers and surface grinder.
Machinist/Job Setter	- Carries through to completion the construction and repair of all kinds of metal parts, tools and machines.
Mail Carrier	- Delivers mail to private homes and business establishments along an established route, after sorting mail.
Maintenance Man Bldg.	- Keeps physical structure of an office building, factory, apartment house or similar structure in good repair.
Maintenance Mechanic	- Keeps machinery and mechanical equipment of an establishment in a state of good repair.
Manager/Official	- Involved primarily with responsible policy-making, planning, supervising, coordinating, or guiding the work activity of others.
Meat Cutter	- Displays and sells meat, cuts meat to size, cleans fish and poultry.
Metal Finisher	- Filing, polishing, grinding or buffing metal to put proper finish on metal.
Meter Reader	- Reads recording dials of gas, electric, steam or water meters and records data.
Miller	- Grinds material, such as coal, cocoa beans, coffee, grain, or ore, using a machine.
Millman	- General form applied to worker who grinds and pulverizes materials. Usually classified according to material processed.
Millman Wood	- Fabricates various lumber products, such as sashes, window frames and door frames, doors and furniture parts, woodworking machines, and hand or powered saws.
Millwright	- Lays out, assembles, installs, repairs and dismantles heavy machinery and mechanical equipment in plants where moving machinery is installed.
Molder	- Prepares molds for casting using various hand tools.
Nurse Aide/Orderly	- Assists professional staff performing routine tasks.
Nurse, Licensed Practical	- Performs a combination of duties in hospitals or nursing homes. Must have Ohio State License.
Nurse Registered	- A person who has successfully completed an approved course of study at an accredited school of nursing and who holds a certificate of registration or license to practice.
Office Machine Operator	- Operates various machines found in an office and used in performing clerical duties.
Office Machine Serviceman	- Inspects, adjusts repairs, cleans and services office machines.
Oiler	- Lubricates in routine manner the moving parts or wearing surfaces of mechanical equipment.
Optician	- Makes eyeglass lenses to prescription of Oculist or Optometrist and assembles lenses in frames.
Packer/Wrapper	- Packs finished or wrapped products in cardboard or wooden boxes, cartons, kegs or other containers preparatory to shipment or storage.

Painter	- Performs all classes of painting work. Mixes paints and matches colors. Uses brushes and spray gun to apply paint. May remove old paint.
Painter, Spray	- Fills spray gun container with finishing or protecting material and coats surfaces of machines, manufactured articles and working areas.
Pasteurizer	- Pasteurizes raw milk to remove harmful bacteria by opening and closing valves and electric switches to pump the cold raw milk from the storage tanks through a heating tank and pump the hot milk through a cooling unit to a bottling machine.
Patternmaker	- Shapes rough patterns according to specifications shown on blueprints using appropriate machines and hard tools.
Pharmacist	- Compounds and dispenses medicines and preparations as directed by prescriptions prepared by licensed physicians and dentists.
Photographer	- Photographs persons, merchandise, exteriors and interiors, machinery and fashions both indoors and outdoors to be used in advertising and selling.
Plasterer	- Applies plaster to wall or ceiling with trowel. Pushes template over plaster, striking off excess plaster, until desired shape and smoothness of molding is obtained.
Plater	- Covers metal objects with a coating of another metal, usually electroplating.
Plumber/Pipefitter	- Installs, bends, cuts and threads air, water, gas pipe and fittings. Keeps pipe in good repair.
Policeman/Guard	- Guards an industrial plant, warehouse, or other property against fire, theft and illegal entry. Police officer or patrolman (gov. serv.)
Postal Clerk	- Prepares incoming mail for distribution and outgoing mail for mailing.
Power Press Operator	- A worker who operates a power-driven press to punch, trim, forge, or perform other shaping or fabricating operations.
Presser, Garment	- Smooths surfaces of garments using pressing machines.
Pressman, Printing	- Makes ready and tends the operation of any type of printing press.
Programmer	- Develops procedures to process data and prepares diagrammatic plans for solution of scientific and mathematical problems by means of automatic data-processing equipment.
Radio Operator	- Receives and sends commercial messages using radiotelegraph or radiotelephone equipment, or both.
Rate Clerk	- Determines rates and classifications applicable to various types of merchandise to be shipped or other rates such as passenger tickets.
Reporter	- Collects accurate, pertinent facts, by interview or investigation, about events having news value. Takes notes. Writes or types stories, referring to related material as necessary.
Roofer	- Lays any one of a variety of roofing materials, repairs and maintains.
Room Clerk	- Rent and assigns rooms, maintains records of reservations and other related duties.
Routeman	- Drives a truck over an established route to deliver bread, milk, ice, laundry, dry cleaning or ice cream to regular customers.

Rubber Compounder	- Assembles specified quantities of materials to be mixed together to form uncured rubber used in making rubber products.
Rubber Pressman	- Forms rubber rings, cups, washers and other articles in a hydraulic press.
Salesman, General	- Solicits customers, frequently outside of store to demonstrate and sell merchandise (auto, boats, appliances, etc.) to the customer.
Salesman, Real Estate	- Rents and sells property for clients on a commission basis.
Salesperson, Retail	- Displays, explains and sells merchandise on sales floor.
Sandblaster	- Cleans, paint, scale, grease, tar, rust and dirt from surface of metal or hard composition objects.
Secretary	- Performs confidential office work in relieving company officials of minor executive and clerical duties. Takes dictation, types, handles correspondence.
Sewing Machine Operator	- Performs any or all sewing machine operations on various fabrics to produce articles such as garments, upholstery, awnings or textile products.
Sheetmetal Worker	- Fabricates, assembles, alters, repairs and installs sheetmetal articles and equipment.
Shipping Clerk	- Receives goods shipped to an establishment, unpacks and verifies correctness of shipments against invoices and other records. Ships material from establishment and may keep record of stock.
Spring & Mattress Maker	- Assembles and fastens coil springs together in a spring frame to form bedsprings or chair-seat springs.
Stationary Engineer	- Operates and maintains stationary engines and mechanical equipment. Observes meters and gages to determine operating condition of equipment. License required.
Stenographer	- Takes dictation in shorthand of correspondence, reports and other matter and transcribes dictated material. May perform a variety of related clerical duties.
Stillman	- Supervises, directs, and is responsible for continuous, economical, and safe operation of one or a battery of stills in which crude or other oil is distilled to break it down into such products as gasoline, kerosene, lubricating oil, fuel oil and petroleum coke.
Stock Clerk	- Receives, stores and issues equipment, material, merchandise or tools in a stockroom or storeroom.
Structural Steel Worker	- Works as a member of a group that raises and places fabricated structural steel members and unites them permanently to form a completed structure.
Surveyor	- Supervises, directs and is responsible for the accuracy of the work of an engineering survey party.
Tabulating Machine Operator	- Operates a machine that automatically analyzes, makes calculations and translates or divides information represented by holes punched in groups of tabulating cards, and prints the translated data on form sheets.
Tailor/Seamstress	- Makes tailored garments and performs the more difficult hand and machine sewing tasks in their construction.
Teacher	- Instructs pupils of grade, grammar or high school in rural or urban communities.

Telephone Operator	- Operates switchboard to relay incoming calls to inter-office phones and to make connections with outside phones.
Teller/Financial Clerk	- Receives and pays out money, keeping accurate records.
Tester (Machine Shop)	- Cuts to specified dimensions metal specimens which are to be subjected to various physical tests in a laboratory, performing a series of simple, repetitive machining operations on machine tools which have been set up by other workers.
Textile Machine Operator	- This covers occupations concerned with the spinning of all types of thread and yarn including the weaving of cotton, rayon, silk, woolen, worsted, and mixed fabrics.
Timekeeper	- Keeps a daily record showing time of arrival on job and departure from work of company employees.
Tire Finisher	- Applies insignia striping to tires after inspecting them. Mounts tires on a free spindle and marks tires.
Tool & Die Maker	- Constructs, repairs and maintains machine shop tools, jigs, fixtures and instruments, calibrating them according to specification, as well as dies used for forging, punching, stamping and other metal-forming work.
Tool Grinder	- Sharpens tools that need not be ground to a very fine tolerance.
Truck Driver	- Drives a truck to transport materials, merchandise, equipment or men.
Truck Mechanic	- Repairs and overhauls truck motors and associated equipment such as power winches, etc.
Tube Machine Operator	- Forms rubber into a tubular, flat or irregularly shaped continuous strip by machine.
Undertaker	- Makes arrangements for and conducts funerals; directs pallbearers. Prepares body for shipment and frequently embalms body.
Undertaker Assistant	- Assists undertaker in preparing for and conducting funerals. Places coffin in position for service and arranges flowers and lights. Acts as receptionist. May help to embalm body.
Upholsterer	- Installs, arranges and secures springs padding and covering material such as cloth or leather to frames of furniture.
Waiter/Waitress	- Serves food to customers in quick and efficient manner. Sets table with clean linen and silver-ware.
Warehouseman	- Loads, unloads, record routs, and delivers incoming and outgoing merchandise in a warehouse.
Watch Repairman	- Cleans, adjusts, repairs and oils watches.
Welder	- Operates both electric-welding and acetylene - welding apparatus to fuse metal parts.

Extracts from Medina County Joint Vocational School District Survey

Exhibit B_2

Table 15:--Per Cent of Persons Working Outside County of Residence, 1960 (13)

Area	Per Cent	Rank
Highest County	60.4	1
Medina County	43.2	5
Lake County	42.8	6
Portage County	37.1	9

Ashland County	18.2	42½
Huron County	18.1	44½
Median *	18.1	44½
Lorain County	14.1	58½
Ashtabula County	11.7	66
Erie County	11.3	67½
Ohio State *	11.3	67½
Mahoning County	9.2	72
Summit County	7.6	79
Stark County	5.8	80½
Richland County	4.3	85
Cuyahoga County	2.1	88
Lowest County	2.1	88

* If a community had this ratio, it would have been ranked as indicated.

The Bureau of Unemployment Compensation, State of Ohio, conducts Occupational Surveys, collects information on employment by industrial classifications and by level of occupation. These surveys also estimate future employment needs by industrial classifications and by level of occupations. The surveys likewise collect information on the major occupations in the labor force areas studied. Those occupations showing greatest future shortage are designated as principal demands. A tremendous quanity of information is contained in these studies, but only a small portion has been extracted for specific use here.

presents vital information on current employment and future needs in levels of skilled occupations. The tables must be studied for detailed information.

Table 21, Principal Occupational Needs for Twenty-Four Month Period From Occupational Survey Finding in North Eastern Ohio, shows the needs for each of principal demand occupations listed in the surveys. Here again, the table must be studied for detailed information. In studying this table, it must be understood that blanks will occur because the occupation was either not listed in the survey or not considered one of the principal demands.

Implications

Two out of five workers who reside in Medina County work outside the county. If the vocational program is based on employment in Medina County, it will not include the employment opportunities open to adults. Under these circumstances, the breadth of the program may be increased as indicated by employment and principal occupational demands of counties in the Lakeshore Uplands Region. An examination of the occupations having principal demand will show that vocational education can prepare youth for most of them.

BUREAU OF UNEMPLOYMENT COMPENSATION

JAMES A. RHODES, *Governor*
WILLARD P. DUDLEY, *Administrator*

OHIO LABOR FORCE ESTIMATES, BY COUNTY

THE BUREAU OF UNEMPLOYMENT COMPENSATION, AIDED BY ITS LOCAL NETWORK OF OHIO STATE EMPLOYMENT SERVICE OFFICES, PREPARES PERIODIC LABOR FORCE REPORTS FOR EACH OF OHIO'S 88 COUNTIES. THESE ONE-PAGE STATEMENTS, UPDATED EVERY FOUR MONTHS, OFFER CURRENT ESTIMATES OF THE LABOR FORCE, EMPLOYMENT, AND UNEMPLOYMENT, AS WELL AS QUALITATIVE INFORMATION ON THE LABOR SUPPLY.

THE LATEST AVAILABLE REPORT FOR A GIVEN COUNTY, AS OF JUNE 30, 1966, PRESENTS ESTIMATES FOR THAT COUNTY FOR THE REFERENCE MONTH INDICATED.

Ohio Labor Market Bulletin
BUREAU OF UNEMPLOYMENT COMPENSATION

JAMES A. RHODES, *Governor*
WILLARD P. DUDLEY, *Administrator*

OHIO LABOR MARKET, JUNE 1966

Remarkably low! That's the level for unemployment in Ohio. Overall rate of unemployment, at 2.6 percent of civilian labor force in April, was lowest on record. Though estimates were first prepared in January 1960, latest figure was probably below any month since 1956. With new entrants to labor force starting to rise, May 1966 figure (not yet available) may be a little higher.

How many claimants? Persons out of work one week or longer and claiming benefits under Ohio Unemployment Compensation Law totaled less than 21 thousand last week. This was lowest figure for any week since November 1952. Eight out of every thousand workers covered under the Law are claiming benefits.

What about benefits? During first five months of 1966 claimants with dependents averaged $48.28 per week of total unemployment, while claimants without dependents averaged $34.73. Corresponding figures for same months of 1965 were slightly lower. Nevertheless, aggregate cost of benefits in Ohio dropped sharply--down 30 percent. Fewer have been unemployed, and for shorter lengths of time. The number unemployed long enough to exhaust their benefit rights dropped 42 percent.

How much in collections? With covered employment continuing at record-high levels, employer contributions (including interest on the Fund) amounted to $103.6 million during first five months of 1966--virtually the same as in comparable months of 1965. With benefits totaling less than $31.2 million in 1966 (through May 31) the Ohio Fund available for further benefits hit $433.7 million. This is highest balance on record since September 30, 1958. Recovery since all-time low of $67.6 million on April 30, 1963 has been fairly steady. All-time peak was reached as of December 31, 1953, when the Fund contained $686.5 million.

Is business cycle "dead"? Chase Manhattan Bank of New York recently received replies to this question from more than five hundred economists. Ninety-three percent of university economists and 95 percent of business economists said "No."

What would recession cost? As yet, no recession is in sight. During most severe 12 months of national recession of 1960-61 unemployment benefits under Ohio Unemployment Compensation Law totaled $302.2 million. With more covered workers and higher earnings a future recession could cost as much or more.

Immediate prospects? Figures for June, July, and August will probably show some increase in unemployment, as students enter labor market and as automotive industry cuts back production and prepares for new models. (6-15-66)

HOCKING COUNTY, OHIO

Labor Force In February 1966, the Hocking County civilian workforce totaled around 6,400. Of this number, an estimated 5,700 were employed and 700 (including 200 women) were jobless. Those unemployed represented 10.9 percent of the labor force.

Location Hocking County is situated in south-central Ohio. In July 1964, its population was 20,500--up over 300 from the 1960 U.S. Census count. The principal city and County seat, Logan, had 6,400 inhabitants in 1960.

Industries According to 1960 U.S. Census reports close to one-fourth of the resident jobholders traveled to work in nearby counties. During February almost two-fifths of the persons employed within County borders were on factory payrolls. Leading industries are stone-clay-glass, rubber, nonelectrical machinery, fabricated metals, and paper. Items turned out locally include abrasive wheels, clay sewer pipe, face brick, glass tubing, auto crash-pads, fabricated metal products, and office filing supplies.

Jobseekers Nearly one-fourth of the men seeking work through the local office of the Ohio State Employment Service were skilled and around three-tenths were semiskilled. The rest were largely unskilled or inexperienced. Seven-tenths were not yet 45 years old. A number had worked in the production of shoes as cobblers, lasters, heel trimmers, scourers, treers, and packers; and in aircraft plants as drill and punch press operators and assemblers. Others had experience in clay products concerns as brick and tile setters, kiln burners, off-bearers, and laborers, and in electrical products firms as machine adjusters and unskilled workers. Also in supply were circular saw and planer operators, spray finishers, and laborers from woodworking plants, and truck drivers and laborers from the construction industry. Needed are doctors, laboratory technicians and assistants, machinists, tool and die makers, and automobile mechanics.

Of the women registrants in February, over one-sixth were trained clerical or sales workers and close to one-fifth were qualified for service positions. Better than one-sixth were semiskilled while the balance were, for the most part, unskilled or inexperienced. One out of two was under the age of 35. Many had job backgrounds in the production of shoes as stitchers, treers, lacers, assemblers, and inspectors. Others had worked in electrical equipment firms as assemblers, testers, winders, and packers. Area employers are currently having difficulty finding registered and practical nurses, nurse aides, waitresses, and domestics.

Wage Rates County manufacturers usually offer entry hourly wage rates which vary as follows. Men: unskilled, $1.25 to $1.90; semiskilled, $1.65 to $2.25; skilled, $1.90 to $3.00. Women: unskilled, $1.25 to $1.70; semiskilled, $1.45 to $1.90; skilled, $1.75 to $2.25.

*Composite of twenty-four surveyed counties. See Exhibit H for source of material.

**Number of occupations varied from 97 to 165 in surveys.

***Weighted average.

****These Occupational Surveys involved twenty-four counties---Sandusky, Clinton, Fayette, Highland, Pike, Ross, Allen, Clark, Hancock, Hardin, Putnam, Wyandot, Summit, Richland, Ashland, Lorain, Tuscarawas, Licking, Marion, Cuyahoga, Lake, Erie, Ottawa and Huron.

Employment Aspect

Table 13[b], Total and Farm Workers Employed for Selected Counties in Ohio, 1960, indicates the relative importance of farming by the number of workers employed. There were 92.57 persons in other occupations to every one farmer. Only 6 counties had a higher ratio. It had 8 times as many other workers to every farmer as did the median in the state. Mahoning County, like most of the counties near it, was decidedly industrialized. This would imply that vocational education programs should be weighted in favor of those occupations found in and supporting industry and business.

Table 13[b]:--Total and Farm Workers Employed for Selected Counties in Ohio, 1960 (2-A9)

Area	Total Employed	Farmers, Farm Managers, Foreman, and Laborers	Ratio Total Employed to Farm Employed	Rank of Ratio
Highest County	642,835	1,187	541.56	1
Cuyahoga County	642,835	1,187	541.56	1
Summit County	188,960	796	237.38	3
Mahoning County	104,884	1,133	92.57	7
Lake County	53,582	782	68.52	8
Jefferson County	32,784	519	63.17	9
Trumbull County	73,060	1,200	60.88	10
Stark County	120,895	2,009	60.18	11

Medina County	22,776	1,480	15.39	35
Ashtabula County	32,196	2,207	14.59	37
Median*	--	--	12.34	44 1/2
Wayne County	27,386	3,229	8.48	57
Carroll County	6,904	969	7.12	65
Lowest County	5,910	1,853	3.19	88

*If a community had this ratio, it would have been ranked as indicated.

Table 14, Ratio of Persons Not in Labor Force (Including Children Under Fourteen) to Labor Force for Selected Counties in Ohio, 1960, presents an index or density of employed persons in the population. Mahoning County had a density near the median as did most of the counties near it. About one person in every 2.68 persons was working.

For planning a vocational program, this implies that no adjustment factor need be added in the quantity of vocational programs to prepare high school pupils for adult employment.

Table 14:--Ratio of Persons Not in Labor Force (Including Children Under Fourteen) to Labor Force for Selected Counties in Ohio, 1960 (24-223)

*If a community had this ratio, it would have been ranked as indicated.

Mahoning County ranked 72nd in the State in the per cent of persons working outside the county of residence. Mahoning County is unlike most of the counties near it in this respect. See Table 15, Per Cent of Persons Working Outside County of Residence for Selected Counties in Ohio, 1960. Only about one person in every 10 persons was working outside the county.

For vocational education planning, this implies that it is not necessary to prepare pupils for employment opportunities outside the county as the present population is not traveling outside the county for work.

Table 15:--Per Cent of Persons Working Outside County of Residence for Selected Counties in Ohio, 1960 (24-223)

The Bureau of Unemployment Compensation, State of Ohio, in conducting occupational surveys, collects information on employment by industrial classifications and by occupational skill levels. The surveys also contain future employment needs by industrial classifications and by occupational skill levels. Those occupations showing greatest future shortages are designated as principal demands. Information pertaining to clerical, sales, service, skilled and semi-skilled occupations has been reproduced for use in this report.

Table 16, Employment and Reported Needs in Clerical Occupations for Twenty-four Months; Table 17, Employment and Reported Needs in Sales Occupations for Twenty-four Months; Table 18, Employment and Reported Needs in Service Occupations for Twenty-four Months; Table 19, Employment and Reported Needs in Skilled Occupations for Twenty-four Months; and Table 20, Employment and Reported Needs in Semi-skilled Occupations for Twenty-four Months presents vital information on employment and needs by occupational levels.

Table 21, Principal Occupational Needs for Twenty-four Months, shows the need for the principal demand occupations listed in the surveys. The table should be studied for detailed information on occupational needs. In studying this table, it should be understood that blanks will occur because the occupation was either not studied in the survey or not considered one of the principal demands.

In planning the vocational program for Mahoning County, this information indicates that if the vocational program is based on employment in the local community it will not prepare youth for the many employment opportunities open to qualified workers. Therefore, the breadth of the program should be increased as indicated by employment and known principal occupational demands of counties which have had occupational surveys. An examination of the listed occupations in principal demand shows that vocational education prepares youth for most of them and that the occupational employment and demands can be used as guidelines in preparing the vocational program.

SHORTAGE AND SURPLUS OCCUPATIONS*

FIRST QUARTER 1966

Reflecting the general improvement in the economy, shortage occupations both for men and women were more widely reported in the first quarter of 1966 than in the corresponding quarter of 1965. Surplus occupations were less apparent though the pattern was more evident for women than for men.

Five men's shortage occupations were reported in 25 or more counties during the quarter just completed--machinists, draftsmen, engineers, tool and die makers, and welders. A year earlier, only machinists were scarce in as many local areas. Counties were added for nearly all occupations previously listed, including foremen, managers, and such white-collar skills as salesworkers and accountants.

In women's shortage occupations, shortages were also more widespread in the first quarter of 1966 than a year ago. The leaders were the same: secretaries and stenographers, practical and registered nurses. Shortages of waitresses, bookkeepers, and clerk-typists were more extensively noted. Nurse aides, housekeepers, and domestics were added to the current list.

As can be expected in winter, men's surplus occupations were dominated by construction jobs. Aside from factory laborers (ranking fourth in number of counties listed) the leaders were construction laborers, truck drivers, carpenters, painters, operating engineers, heavy equipment operators, and bricklayers. Some of these occupations, notably heavy equipment operators, were reported surplus more widely than in the first quarter of 1965. In general, factory occupations were down in the number of local areas indicating surpluses. This was particularly true for assemblers, machine operators, press operators, welders, packers, and loaders.

Heading the women's surplus occupations in the first quarter of 1966 were general office clerks, salesworkers, waitresses, assemblers, and packers--the same occupations reported a year earlier. Fewer counties had surpluses of women as salesworkers, assemblers, clerk-typists, sewing machine operators, inspector-gauger-testers, press operators, and nurse aides.

---

*SHORTAGE OCCUPATIONS ARE THOSE FOR WHICH THERE WAS A SIGNIFICANT LACK OF QUALIFIED CANDIDATES TO MEET DEMANDS IN THE GIVEN COUNTY. SURPLUS OCCUPATIONS ARE THOSE IN WHICH THERE WERE SUBSTANTIALLY MORE CANDIDATES AVAILABLE IN THE COUNTY THAN WERE IN DEMAND THERE. THESE DATA WERE COMPILED FROM REPORTS SUBMITTED BY LOCAL OHIO STATE EMPLOYMENT SERVICE OFFICES, BASED ON JOB ORDERS AND RELATED INFORMATION FROM EMPLOYERS, AND ON LOCAL OFFICE FILES OF REGISTERED JOBSEEKERS.

For additional Labor Market Information, write

SHORTAGE OCCUPATIONS FOR MEN

Machinists (44 counties) -- Allen, Athens, Auglaize, Belmont, Butler, Champaign, Clark, Columbiana, Coshocton, Crawford, Cuyahoga, Darke, Defiance, Erie, Franklin, Geauga, Hamilton, Hancock, Hardin, Hocking, Huron, Knox, Lake, Licking, Logan, Lorain, Lucas, Mahoning, Medina, Mercer, Miami, Montgomery, Muskingum, Ottawa, Portage, Sandusky, Scioto, Seneca, Stark, Summit, Trumbull, Tuscarawas, Warren, Wood.

Draftsmen (31 counties) -- Ashtabula, Auglaize, Butler, Champaign, Clark, Columbiana, Coshocton, Cuyahoga, Darke, Erie, Fairfield, Franklin, Geauga, Hamilton, Knox, Lake, Lawrence, Logan, Lorain, Lucas, Mahoning, Marion, Medina, Miami, Montgomery, Sandusky, Shelby, Summit, Trumbull, Warren, Washington.

Engineers--chemical, civil, electrical, industrial, mechanical (28 counties) -- Allen, Ashtabula, Auglaize, Butler, Clark, Columbiana, Coshocton, Cuyahoga, Franklin, Geauga, Hamilton, Hancock, Hardin, Knox, Lake, Logan, Lorain, Lucas, Mahoning, Medina, Mercer, Montgomery, Putnam, Scioto, Stark, Summit, Trumbull, Wyandot.

Tool and die makers (27 counties) -- Ashtabula, Clark, Columbiana, Coshocton, Cuyahoga, Darke, Defiance, Franklin, Fulton, Geauga, Hamilton, Hardin, Henry, Hocking, Lake, Lorain, Lucas, Marion, Miami, Montgomery, Muskingum, Ottawa, Sandusky, Shelby, Stark, Summit, Trumbull.

Welders (25 counties) -- Allen, Auglaize, Butler, Columbiana, Cuyahoga, Erie, Franklin, Hamilton, Hardin, Knox, Lorain, Lucas, Marion, Medina, Mercer, Miami, Portage, Seneca, Shelby, Summit, Trumbull, Tuscarawas, Warren, Wayne, Wood.

Electricians (19 counties) -- Clinton, Defiance, Erie, Fairfield, Fayette, Hardin, Henry, Knox, Licking, Lorain, Lucas, Marion, Medina, Muskingum, Sandusky, Seneca, Stark, Summit, Tuscarawas.

Automobile mechanics (18 counties) -- Butler, Clermont, Clinton, Cuyahoga, Defiance, Erie, Franklin, Hamilton, Hancock, Hocking, Knox, Lake, Lucas, Montgomery, Pike, Seneca, Stark, Tuscarawas.

Machine operators, miscellaneous (18 counties) -- Allen, Ashtabula, Butler, Clark, Crawford, Cuyahoga, Defiance, Fairfield, Lake, Logan, Lucas, Marion, Medina, Stark, Summit, Trumbull, Tuscarawas, Wood.

Engine and turret lathe operators (16 counties) -- Ashtabula, Auglaize, Butler, Champaign, Clark, Cuyahoga, Defiance, Franklin, Hamilton, Hancock, Holmes, Lucas, Marion, Mercer, Warren, Wayne.

Salesworkers (16 counties) -- Columbiana, Cuyahoga, Erie, Fayette, Franklin, Gallia, Greene, Jefferson, Lawrence, Montgomery, Ottawa, Pike, Ross, Scioto, Summit, Williams.

Accountants (14 counties) -- Butler, Erie, Franklin, Hamilton, Knox, Lawrence, Lucas, Mahoning, Morgan, Scioto, Stark, Summit, Trumbull, Williams.

Milling machine operators (10 counties) -- Butler, Clark, Cuyahoga, Hamilton, Hancock, Holmes, Lucas, Trumbull, Warren, Wayne.

Social workers--case and group (10 counties) -- Butler, Clermont, Cuyahoga, Franklin, Hamilton, Lorain, Lucas, Mahoning, Montgomery, Summit.

Repairmen--electrical and electronic (8 counties) -- Clark, Cuyahoga, Fayette, Franklin, Hamilton, Licking, Marion, Tuscarawas.

Boring machine operators (7 counties) -- Butler, Clark, Cuyahoga, Franklin, Hamilton, Lucas, Trumbull.

Electronic technicians (7 counties) -- Cuyahoga, Franklin, Hancock, Mahoning, Montgomery, Putnam, Summit.

Factory maintenance mechanics (7 counties) -- Allen, Clark, Coshocton, Fulton, Hancock, Henry, Marion.

Foremen (7 counties) -- Clark, Franklin, Hamilton, Hancock, Marion, Montgomery, Preble.

Managers, miscellaneous (7 counties) -- Cuyahoga, Franklin, Hamilton, Lorain, Lucas, Richland, Summit.

Millwrights (7 counties) -- Coshocton, Defiance, Lorain, Lucas, Mahoning, Marion, Stark.

Setup men (7 counties) -- Ashtabula, Cuyahoga, Holmes, Lake, Montgomery, Warren, Wayne.

Tool and die designers (7 counties) -- Cuyahoga, Franklin, Hamilton, Montgomery, Stark, Summit, Trumbull.

Chemists (6 counties) -- Cuyahoga, Franklin, Hamilton, Lucas, Montgomery, Summit.

Press operators--punch, drill, forming (6 counties) -- Auglaize, Clark, Hamilton, Hancock, Mercer, Warren.

Clerical workers (5 counties) -- Gallia, Meigs, Miami, Pike, Ross.

Grinders (5 counties) -- Butler, Clark, Cuyahoga, Hamilton, Lucas.

Job setters (5 counties) -- Auglaize, Cuyahoga, Geauga, Henry, Mercer.

Machine tool operators (5 counties) -- Butler, Clermont, Columbiana, Franklin, Shelby.

Patternmakers (5 counties) -- Cuyahoga, Defiance, Hamilton, Knox, Trumbull.

Repairmen, television (5 counties) -- Butler, Cuyahoga, Franklin, Lorain, Richland.

Screw machine operators (5 counties) -- Butler, Cuyahoga, Defiance, Hamilton, Montgomery.

SHORTAGE OCCUPATIONS FOR WOMEN

Secretaries (35 counties) -- Ashtabula, Butler, Columbiana, Coshocton, Cuyahoga, Defiance, Fairfield, Franklin, Geauga, Greene, Hamilton, Hardin, Holmes, Huron, Jefferson, Knox, Lake, Logan, Lorain, Mahoning, Marion, Medina, Morgan, Muskingum, Ottawa, Portage, Sandusky, Stark, Summit, Trumbull, Tuscarawas, Warren, Washington, Wayne, Wood.

Nurses, practical (30 counties) -- Adams, Athens, Auglaize, Belmont, Butler, Clark, Coshocton, Darke, Fayette, Hamilton, Hardin, Hocking, Holmes, Jackson, Knox, Lucas, Mercer, Montgomery, Morgan, Muskingum, Perry, Putnam, Richland, Scioto, Seneca, Summit, Trumbull, Tuscarawas, Warren, Wayne.

Stenographers (30 counties) -- Ashtabula, Auglaize, Belmont, Butler, Champaign, Clark, Columbiana, Coshocton, Cuyahoga, Delaware, Erie, Franklin, Gallia, Geauga, Hamilton, Hardin, Jackson, Lake, Lawrence, Logan, Lorain, Lucas, Marion, Mercer, Montgomery, Muskingum, Portage, Scioto, Stark, Wyandot.

Nurses, registered (23 counties) -- Adams, Athens, Belmont, Butler, Champaign, Clark, Coshocton, Cuyahoga, Erie, Franklin, Hamilton, Hocking, Knox, Lorain, Lucas, Montgomery, Morgan, Muskingum, Ross, Scioto, Summit, Tuscarawas, Warren.

Waitresses (23 counties) -- Ashtabula, Athens, Auglaize, Coshocton, Darke, Defiance, Delaware, Franklin, Gallia, Guernsey, Hancock, Henry, Hocking, Jefferson, Logan, Marion, Meigs, Mercer, Montgomery, Noble, Summit, Trumbull, Wood.

Bookkeepers (14 counties) -- Columbiana, Coshocton, Defiance, Delaware, Gallia, Henry, Lorain, Lucas, Montgomery, Sandusky, Scioto, Stark, Summit, Warren.

Clerk-typists (13 counties) -- Auglaize, Champaign, Clark, Columbiana, Defiance, Erie, Franklin, Geauga, Lake, Lucas, Medina, Mercer, Warren.

Cooks (13 counties) -- Auglaize, Butler, Delaware, Erie, Fairfield, Franklin, Henry, Jefferson, Mahoning, Mercer, Pike, Seneca, Summit.

Housekeepers (13 counties) -- Brown, Butler, Clermont, Columbiana, Cuyahoga, Hancock, Hardin, Lorain, Medina, Putnam, Ross, Stark, Tuscarawas.

Domestics (12 counties) -- Athens, Defiance, Franklin, Geauga, Hamilton, Hocking, Lake, Pike, Sandusky, Scioto, Summit, Warren.

Nurse aides (11 counties) -- Auglaize, Butler, Hocking, Holmes, Mercer, Morgan, Muskingum, Perry, Tuscarawas, Warren, Wayne.

Child monitors (9 counties) -- Fairfield, Hancock, Jackson, Lorain, Meigs, Ottawa, Putnam, Stark, Washington.

Social workers--case and group (9 counties) -- Butler, Clermont, Cuyahoga, Franklin, Hamilton, Lucas, Mahoning, Montgomery, Summit.

Medical technicians (7 counties) -- Cuyahoga, Franklin, Hamilton, Miami, Summit, Trumbull, Warren.

Salesworkers (6 counties) -- Gallia, Greene, Henry, Logan, Meigs, Summit.

Home care attendants (5 counties) -- Mahoning, Miami, Ottawa, Seneca, Washington.

Maids (5 counties) -- Cuyahoga, Erie, Hancock, Lake, Montgomery.

Pressers (5 counties) -- Cuyahoga, Lucas, Montgomery, Stark, Summit.

SURPLUS OCCUPATIONS FOR MEN

Construction laborers (65 counties) -- Adams, Allen, Ashland, Ashtabula, Athens, Auglaize, Belmont, Brown, Butler, Champaign, Clark, Clermont, Clinton, Columbiana, Coshocton, Cuyahoga, Darke, Defiance, Delaware, Fairfield, Fayette, Franklin, Gallia, Geauga, Guernsey, Hamilton, Hancock, Hardin, Henry, Highland, Hocking, Huron, Jackson, Jefferson, Knox, Lake, Lawrence, Licking, Logan, Lorain, Madison, Meigs, Mercer, Miami, Monroe, Montgomery, Morgan, Muskingum, Ottawa, Pickaway, Pike, Portage, Richland, Ross, Sandusky, Scioto, Seneca, Shelby, Stark, Trumbull, Union, Van Wert, Vinton, Warren, Washington.

Truck drivers (65 counties) -- Adams, Allen, Ashtabula, Athens, Auglaize, Belmont, Brown, Butler, Carroll, Champaign, Clark, Clermont, Clinton, Columbiana, Crawford, Darke, Erie, Fairfield, Fayette, Geauga, Greene, Guernsey, Hamilton, Hancock, Hardin, Harrison, Highland, Hocking, Holmes, Huron, Jefferson, Knox, Lake, Lawrence, Licking, Logan, Lorain, Madison, Marion, Mercer, Miami, Monroe, Morgan, Muskingum, Noble, Ottawa, Perry, Pickaway, Pike, Putnam, Richland, Ross, Sandusky, Scioto, Seneca, Shelby, Stark, Trumbull, Tuscarawas, Union, Van Wert, Vinton, Washington, Wayne, Wood.

Carpenters (40 counties) -- Adams, Belmont, Brown, Butler, Carroll, Champaign, Clark, Clermont, Clinton, Columbiana, Darke, Fairfield, Fayette, Gallia, Geauga, Greene, Hamilton, Hancock, Hardin, Highland, Jackson, Lake, Lawrence, Licking, Logan, Madison, Mahoning, Medina, Meigs, Monroe, Morgan, Muskingum, Noble, Perry, Pickaway, Pike, Portage, Ross, Scioto, Washington.

Factory laborers (36 counties) -- Ashland, Auglaize, Belmont, Brown, Butler, Clermont, Columbiana, Crawford, Cuyahoga, Fulton, Geauga, Hamilton, Henry, Hocking, Holmes, Jefferson, Knox, Lake, Lucas, Madison, Mahoning, Marion, Mercer, Miami, Monroe, Noble, Perry, Pike, Putnam, Stark, Trumbull, Tuscarawas, Van Wert, Vinton, Warren, Wayne.

Painters (24 counties) -- Belmont, Brown, Butler, Carroll, Clark, Clermont, Columbiana, Hamilton, Hancock, Hardin, Huron, Jefferson, Lawrence, Licking, Lucas, Mahoning, Medina, Monroe, Montgomery, Noble, Pickaway, Scioto, Seneca, Washington.

Operating engineers (20 counties) -- Butler, Carroll, Champaign, Clark, Columbiana, Guernsey, Jackson, Lawrence, Licking, Medina, Miami, Monroe, Muskingum, Noble, Portage, Seneca, Stark, Vinton, Warren, Washington.

Heavy equipment operators (19 counties) -- Brown, Butler, Carroll, Clermont, Clinton, Gallia, Greene, Hamilton, Hancock, Jefferson, Logan, Mahoning, Meigs, Monroe, Perry, Pike, Richland, Ross, Stark.

Bricklayers (17 counties) -- Belmont, Clark, Clermont, Columbiana, Crawford, Geauga, Hamilton, Hancock, Lake, Licking, Marion, Medina, Muskingum, Perry, Portage, Trumbull, Washington.

Finishers, cement (13 counties) -- Butler, Champaign, Clark, Crawford, Gallia, Hamilton, Huron, Jackson, Logan, Marion, Montgomery, Pickaway, Portage.

Press operators--punch, drill, forming (12 counties) -- Butler, Carroll, Cuyahoga, Franklin, Geauga, Hocking, Huron, Lake, Lucas, Richland, Stark, Tuscarawas.

Assemblers (11 counties) -- Clermont, Crawford, Cuyahoga, Delaware, Franklin, Hardin, Hocking, Licking, Lucas, Marion, Stark.

Janitors and porters (11 counties) -- Allen, Brown, Butler, Clermont, Cuyahoga, Franklin, Greene, Hamilton, Lucas, Mahoning, Richland.

Bulldozer operators (10 counties) -- Brown, Butler, Carroll, Champaign, Clermont, Harrison, Monroe, Muskingum, Putnam, Tuscarawas.

SURPLUS OCCUPATIONS FOR WOMEN

General office clerks (38 counties) -- Brown, Butler, Carroll, Champaign, Clark, Clermont, Clinton, Columbiana, Darke, Fayette, Fulton, Greene, Hancock, Hardin, Harrison, Henry, Highland, Jackson, Jefferson, Knox, Lawrence, Lorain, Miami, Monroe, Montgomery, Morrow, Muskingum, Paulding, Pickaway, Pike, Richland, Ross, Scioto, Tuscarawas, Van Wert, Warren, Washington, Wood.

Salesworkers (35 counties) -- Adams, Ashland, Athens, Belmont, Brown, Butler, Carroll, Clark, Clermont, Columbiana, Coshocton, Crawford, Defiance, Fayette, Hardin, Harrison, Jackson, Jefferson, Knox, Lorain, Mahoning, Miami, Montgomery, Morrow, Ottawa, Richland, Sandusky, Scioto, Seneca, Shelby, Stark, Trumbull, Tuscarawas, Van Wert, Washington.

Waitresses (31 counties) -- Allen, Belmont, Brown, Butler, Clinton, Erie, Fairfield, Fayette, Hamilton, Hardin, Harrison, Highland, Jackson, Knox, Lorain, Lucas, Miami, Monroe, Muskingum, Ottawa, Pickaway, Pike, Putnam, Richland, Ross, Shelby, Tuscarawas, Union, Vinton, Warren, Washington.

Assemblers (29 counties) -- Ashtabula, Athens, Carroll, Champaign, Clark, Clermont, Cuyahoga, Darke, Delaware, Erie, Franklin, Greene, Guernsey, Hamilton, Hardin, Hocking, Huron, Licking, Lucas, Madison, Mahoning, Muskingum, Noble, Perry, Richland, Seneca, Stark, Warren, Williams.

Packers (25 counties) -- Butler, Carroll, Champaign, Clermont, Coshocton, Cuyahoga, Darke, Erie, Franklin, Greene, Hamilton, Henry, Highland, Hocking, Huron, Licking, Lucas, Medina, Miami, Montgomery, Morgan, Preble, Stark, Summit, Warren.

Cashiers (18 counties) -- Ashland, Athens, Brown, Butler, Carroll, Clark, Clermont, Columbiana, Erie, Hamilton, Jefferson, Lorain, Mahoning, Montgomery, Muskingum, Richland, Scioto, Seneca.

Clerk-typists (13 counties) -- Allen, Athens, Brown, Carroll, Clermont, Guernsey, Hamilton, Huron, Jefferson, Knox, Lawrence, Miami, Scioto.

Sewing machine operators (12 counties) -- Brown, Butler, Clark, Fayette, Hamilton, Lucas, Miami, Noble, Pike, Ross, Stark, Warren.

Press operators--punch, drill, forming (10 counties) -- Belmont, Butler, Carroll, Cuyahoga, Fulton, Geauga, Highland, Lake, Licking, Stark.

TOLEDO OFFICE	724 MONROE STREET	243 - 1141
BOWLING GREEN OFFICE	139 WEST WOOSTER STREET	354 - 0051

TOLEDO METROPOLITAN AREA*

Unemployment Toledo area unemployment dropped from an estimated 7,700 in mid-March to 6,700 in mid-April. As a result, the jobless rate fell from 3.1 percent to 2.7 percent of the civilian labor force. Total employment in April was around 243,900, including persons involved in labor-management disputes, compared with 239,400 in March.

Nonagricultural Jobs Nonfarm wage and salary employment was 213,700 in April--up 3,700 from March. Nonmanufacturing advanced by just that amount with all divisions contributing. The most noteworthy increases occurred in contract construction, services, and retail trade. In manufacturing, nondurable goods was up slightly but there was an offsetting loss in the hard goods sector. Workforce cutbacks in glass, primary metals, and transportation equipment exceeded a moderate gain in fabricated metals.

Year-Ago Comparison Nonagricultural establishments employed 10,500 more persons in April 1966 than they did one year earlier. Nearly seven-tenths of the increment was in nonmanufacturing where gains were universal. Increases in services and government were the most sizable. Most of the gain in manufacturing was centered in the durable goods segment. Though transportation equipment suffered a cutback and stone-clay-glass held close to its year-ago level, every other group was substantially higher. Primary metal industries (+1,000) advanced most significantly.

Hours And Earnings Average weekly earnings of factory production workers rose from $136.62 in March to $141.14 in April while the workweek increased from 42.5 to 43.3 hours. In April 1965, a 40.4 hour workweek yielded $125.69 in gross earnings.

Claims Down In April a weekly average of around 2,000 persons, unemployed one week or more, filed claims in Lucas, Wood, and Monroe Counties for benefits under the Ohio and Michigan Unemployment Compensation Laws. This was 1,450 below the continued claims average for March and 1,650 under the corresponding April 1965 figure.

Supply And Demand At the end of April, some 3,200 men and 2,500 women were registered for work at the Toledo and Bowling Green offices of the Ohio State Employment Service and the Monroe office of the Michigan Employment Security Commission. Local employers have been seeking men qualified as accountants, engineers, retail salespersons, machinists, tool-and-die makers, grinder operators, automobile mechanics, and appliance servicemen. Job opportunities exist for women as bookkeepers, secretaries, typists, pressers from dry cleaning establishments, waitresses, and domestics.

*DEFINED AS LUCAS AND WOOD COUNTIES, OHIO, AND MONROE COUNTY, MICHIGAN.

[a]Estimated in cooperation with U.S. Bureau of Labor Statistics. Toledo area is defined as Lucas and Wood Counties, Ohio, and Monroe County, Michigan. Data relate to full and part-time production workers (nonsupervisory employees in nonmanufacturing) employed during pay periods which include the 12th of the month. Average earnings are computed from gross payroll before tax and other deductions. Includes pay for overtime, incentive bonuses paid regularly, holidays, vacations, and sick leave. Excludes special bonuses, retroactive pay, and payments in kind. [b]Preliminary. [c]Revised. [d]Includes ordnance; lumber and wood products; furniture and fixtures; electrical machinery; instruments, optical goods, and clocks; miscellaneous manufacturing. [e]Includes tobacco manufactures; textile mill products; apparel and other finished fabric products; paper and allied products; printing, publishing, and allied industries; chemicals and allied products; rubber and miscellaneous plastics products; leather and leather products. [f]Excludes eating and drinking places. [g]Low due to labor-management disputes during part of pay period.

OHIO LABOR MARKET, JUNE 1966

Remarkably low! That's the level for unemployment in Ohio. Overall rate of unemployment, at 2.6 percent of civilian labor force in April, was lowest on record. Though estimates were first prepared in January 1960, latest figure was probably below any month since 1956. With new entrants to labor force starting to rise, May 1966 figure (not yet available) may be a little higher.

How many claimants? Persons out of work one week or longer and claiming benefits under Ohio Unemployment Compensation Law totaled less than 21 thousand last week. This was lowest figure for any week since November 1952. Eight out of every thousand workers covered under the Law are claiming benefits.

What about benefits? During first five months of 1966 claimants with dependents averaged $48.28 per week of total unemployment, while claimants without dependents averaged $34.73. Corresponding figures for same months of 1965 were slightly lower. Nevertheless, aggregate cost of benefits in Ohio dropped sharply--down 30 percent. Fewer have been unemployed, and for shorter lengths of time. The number unemployed long enough to exhaust their benefit rights dropped 42 percent.

How much in collections? With covered employment continuing at record-high levels, employer contributions (including interest on the Fund) amounted to $103.6 million during first five months of 1966--virtually the same as in comparable months of 1965. With benefits totaling less than $31.2 million in 1966 (through May 31) the Ohio Fund available for further benefits hit $433.7 million. This is highest balance on record since September 30, 1958. Recovery since all-time low of $67.6 million on April 30, 1963 has been fairly steady. All-time peak was reached as of December 31, 1953, when the Fund contained $686.5 million.

Is business cycle "dead"? Chase Manhattan Bank of New York recently received replies to this question from more than five hundred economists. Ninety-three percent of university economists and 95 percent of business economists said "No."

What would recession cost? As yet, no recession is in sight. During most severe 12 months of national recession of 1960-61 unemployment benefits under Ohio Unemployment Compensation Law totaled $302.2 million. With more covered workers and higher earnings a future recession could cost as much or more.

Immediate prospects? Figures for June, July, and August will probably show some increase in unemployment, as students enter labor market and as automotive industry cuts back production and prepares for new models. (6-15-66)

HOCKING COUNTY, OHIO

Labor Force In February 1966, the Hocking County civilian workforce totaled around 6,400. Of this number, an estimated 5,700 were employed and 700 (including 200 women) were jobless. Those unemployed represented 10.9 percent of the labor force.

Location Hocking County is situated in south-central Ohio. In July 1964, its population was 20,500--up over 300 from the 1960 U.S. Census count. The principal city and County seat, Logan, had 6,400 inhabitants in 1960.

Industries According to 1960 U.S. Census reports close to one-fourth of the resident jobholders traveled to work in nearby counties. During February almost two-fifths of the persons employed within County borders were on factory payrolls. Leading industries are stone-clay-glass, rubber, nonelectrical machinery, fabricated metals, and paper. Items turned out locally include abrasive wheels, clay sewer pipe, face brick, glass tubing, auto crash-pads, fabricated metal products, and office filing supplies.

Jobseekers Nearly one-fourth of the men seeking work through the local office of the Ohio State Employment Service were skilled and around three-tenths were semiskilled. The rest were largely unskilled or inexperienced. Seven-tenths were not yet 45 years old. A number had worked in the production of shoes as cobblers, lasters, heel trimmers, scourers, treers, and packers; and in aircraft plants as drill and punch press operators and assemblers. Others had experience in clay products concerns as brick and tile setters, kiln burners, off-bearers, and laborers, and in electrical products firms as machine adjusters and unskilled workers. Also in supply were circular saw and planer operators, spray finishers, and laborers from woodworking plants, and truck drivers and laborers from the construction industry. Needed are doctors, laboratory technicians and assistants, machinists, tool and die makers, and automobile mechanics.

Of the women registrants in February, over one-sixth were trained clerical or sales workers and close to one-fifth were qualified for service positions. Better than one-sixth were semiskilled while the balance were, for the most part, unskilled or inexperienced. One out of two was under the age of 35. Many had job backgrounds in the production of shoes as stitchers, treers, lacers, assemblers, and inspectors. Others had worked in electrical equipment firms as assemblers, testers, winders, and packers. Area employers are currently having difficulty finding registered and practical nurses, nurse aides, waitresses, and domestics.

Wage Rates County manufacturers usually offer entry hourly wage rates which vary as follows. Men: unskilled, $1.25 to $1.90; semiskilled, $1.65 to $2.25; skilled, $1.90 to $3.00. Women: unskilled, $1.25 to $1.70; semi-skilled, $1.45 to $1.90; skilled, $1.75 to $2.25.

OHIO LABOR FORCE ESTIMATES, BY COUNTY

THE BUREAU OF UNEMPLOYMENT COMPENSATION, AIDED BY ITS LOCAL NETWORK OF OHIO STATE EMPLOYMENT SERVICE OFFICES, PREPARES PERIODIC LABOR FORCE REPORTS FOR EACH OF OHIO'S 88 COUNTIES. THESE ONE-PAGE STATEMENTS, UPDATED EVERY FOUR MONTHS, OFFER CURRENT ESTIMATES OF THE LABOR FORCE, EMPLOYMENT, AND UNEMPLOYMENT, AS WELL AS QUALITATIVE INFORMATION ON THE LABOR SUPPLY.

THE LATEST AVAILABLE REPORT FOR A GIVEN COUNTY, AS OF MAY 31, 1966, PRESENTS ESTIMATES FOR THAT COUNTY FOR THE REFERENCE MONTH INDICATED.

OVEP-2a

1. Dictionary of Occupational Titles CODE and OCCUPATIONAL TITLES for which training will be offered to high school youth (It is assumed that facilities planned for H. S. youth will be used for out-of-school youth and adults as well):

DOT Code	Occupational Titles	Section No.	Grade Level	Length of program in Hrs. per yr.	Annual Starting Date	Annual Ending Date	Section Enrollment	Expected Graduates	Service[1]	Evidence of need for program (Attach supporting document or statement if space is inadequate.)
Example: 1-01.31	Accounting Clerk	66-A 65-A	11 12	675 675	9/1/66 9/1/66	6/10/67 6/6/67	25 22	20	BOE	OSES Skill Survey attached

[1]Services include: Agriculture, Business & Office, Distributive, Home Economics (Job Training), Trade & Industrial, and Interrelated programs cutting across lines.

Permission granted to duplicate additional forms in district's office.

School District_____ OVEP-2b

2. Trainees: Including Guidance and Selection Procedures — Characteristics including needs, interests, and ability to benefit from training. IQ, socio-economic, student goals, etc. Describe procedures to be followed to determine that students enrolled will be able to profit from instruction.

3. Training plan: Describe plan to accomplish your objectives, including class time schedules, content of courses, outline of program, etc. Use supplemental sheets and attach; show separate for each area and DOT program shown in Item 1, Form 2a. Identify each program by the DOT code; include starting and stopping dates for each year of program.

4. Articulation: Show relationship with on-going vocational program, academic program, pre-requisites, and other related activities.

5. Supervision and direction: How will this be provided. List administrative and supervisory functions and positions, and indicate which persons will meet vocational standards as established in the Ohio Plan for Vocational Education.

6. Plan for evaluating results of project: Show reporting, study, etc.

7. Accessibility: What are the conditions for other districts, non-resident students, and others, to participate in program. Area school definition indicates that five or more vocational education programs must be offered in the same building.

8. Other pertinent information: (Attach supporting documents, reports, and other data that bears on project.)

Item[1]	Number Now In Use	Number This Request	Add'l/Replac.[2] Add	Repl.	Total COST	50% Reimbur. Requested	DO NOT USE
TOTAL EQUIPMENT BUDGET, Forwarded to OVEP-3							

It is understood by the local school that all equipment approved for reimbursement must be kept on a yearly inventory record. Approval of Vocational Division must be received prior to disposal of any equipment on which reimbursement is made. Whenever items of equipment, on which reimbursement is made, are sold or no longer used for purposes for which approved, it is agreed that the proportionate share of the value of the equipment at that time will be returned to the State; the value being determined on the basis of the sale price in the case of a bona fide sale, or the fair market value in the case of discontinuance of use for a vocational education purpose.

VOCATIONAL EDUCATION PROJECT PROPOSAL - CONSTRUCTION OVEP-4
under Vocational Education Act of
1963 and Revised Ohio Plan for
Vocational Education, 1964

1. List the subjects to be offered including the related classes and general subjects offered, estimated enrollment in each area and subject, the number of sections per day required, the number of periods or length of time required for each section, necessary storage, conference areas and service facilities required and the approximate square footage needed for each facility.

Name of Facility by Program as listed in 2a	Maximum Enrollment For Each Facility	Number Sections Per Day	Periods Allot. Each Section		Square Feet Needed	
			Related	Lab-Shop	Related Class Rm.	Lab-Shop
Example: Machine Trade	25	2	2	4	750	3,200

II. Provide in the space below a description (attach a proposed sketch or architect's drawing) of the proposed building including the number of floors, types of construction, and a complete description of the remodeling or alterations required if an existing building is to be used to house a part or all of the vocational education facilities. (Final prints must be approved by both Vocational Education and the Department's Building Section.)

III. Provide a description of the proposed site including information on accessibility, availability of water and other utilities, grading and other site development needed and the geographical location in relation to the district it will serve.

IV. Other Spaces in Building:

OVEP-6

	No. Rooms	Square Feet	DO NOT USE
1. Instruction - non-vocational*	x		
2. Administrative space	x		
3. Service, including utilities and cafeteria	x		
4. Hallways, etc.	x		
5. Recreational, and other non-vocational for which admission fees will be charged*	x		
TOTAL OTHER SPACES	x		

Comments: *(Such areas cannot be reimbursed from VoEd funds.)

V. Summary of Space Requirements:

	No. Rooms	Square Feet	DO NOT USE
1. Vocational labs/shops			
2. Vocational related classrooms			
3. Other reimbursable Spaces (IV)			
4. Non-Reimbursable Spaces (IV)			
TOTAL BUILDING SPACE			

Comments:

VI. Provide complete cost estimate figures for the complete building:

		DO NOT USE
a. Site	$	$
b. Site Improvement		
c. Utilities		
d. Construction and Fixed Equipment		
e. Loose Equipment		
f. Architect's Fees		
g. Miscellaneous and Legal Fees		
Total Estimated Cost	$	$

VII. Source of funds to be used for construction:

		DO NOT USE
a. Local Funds available	$	$
b. State Funds available to district		
c. Other Federal Funds (state the law under which funds will accure)*		
d. Requested funds under Vocational Education Act of 1963		
Total	$	$

*List Law:

VIII. General Requirements:

a. Provide a sketch showing the relative positions of each part of the building including dimensions in feet.

b. Provide an outline of the educational specifications with the application.

c. A qualified professional person or firm shall be hired to prepare plans, cost estimates and supervise the construction of this facility.

d. All facilities shall meet state and local building code requirements.

e. Contracts for construction and hiring practices for laborers and mechanics shall meet all federal and state laws and regulations.

f. Adequate title search or title insurance shall show proof of clear title to the site.

g. Provide evidence that an adequate water supply is available at the site of the proposed building facilities.

Proposed Increases in Teacher Training and Supervision Budget Over 1965-66

OUTLINE FOR DESCRIPTION OF PROJECTED PROGRAM
ACTIVITIES IN VOCATIONAL EDUCATION FOR FISCAL YEAR _____
WITH ESTIMATED EXPENDITURES AND REQUEST FOR TRANSFER OF FUNDS.

Each State with an approved State plan shall submit annually a statement describing its projected program of activities for maintaining, extending, improving, and developing programs of vocational education (including the provision of part-time employment for youths pursuant to section 13 of the Vocational Education Act of 1963), so that persons of all ages in all communities of the State will have ready access to vocational training or retraining which is of high quality, which is realistic in the light of actual or anticipated opportunities for gainful employment, and which is suited to their needs, interests, and ability to benefit from such training.

This statement in effect becomes the State board's annual program plan for vocational education against which year-end reports may be evaluated. In addition, it provides a rationale for State decisions in allocating for various program purposes the Federal funds allotted to it.

An original and ~~one~~ two copy of the description is to be sent to the Assistant Commissioner for Vocational and Technical Education, Office of Education, U.S. Department of Health, Education, and Welfare, Washington, D.C. 20202, on or before May 15, 196_, along with (1) the State's fiscal year Estimate of Total Expenditures and (2) Request for Transfer of Funds.

Describe the following in a concise narrative form and support with appropriate statistical, survey, and evaluative data which is basic to the State's determination of program needs, emphases, and goals for the current fiscal year.

PART A

Items included in this part should relate to the State's total program of vocational and technical education which will be operated during this year.

1. Summarize the current and projected manpower needs and employment opportunities in the State in terms of

   a. Occupations or occupational fields.

   b. Educational levels.

   c. Different labor market areas or communities of the State.

2. Show by county table (inclusive of area vocational school offerings) the program offerings by occupational category and by purpose. (See attached example A)

3. On a State map locate the area vocational schools and indicate the area of the State served by each school. (Also identify by letter "N" which schools will begin operation for the first time during the year.) Show by table the vocational education offerings in each of the area schools identified on the State map. (See attached example B.)

4. Describe the State's plan for the provision of work-study programs under the 1963 Act.

   a. Plans for State administration.

   b. Estimated number of local educational agencies and number of students likely to participate.

5. List the names of members of the State board and/or advisory council, if one has been appointed or designated in compliance with the qualification requirements of section 5(a)(1) of the 1963 Act and Regulation 104.3(b)(1). Identify (1) the persons familiar with the vocational education needs of management and labor in the State and (2) the person or persons representative of junior colleges, technical institutes, or other institutions providing education beyond the high school, and describe their qualifications.

PART B

Items in this part should indicate the State's plan to extend and improve the vocational education program during the year indicating where the emphasis is to be placed and justifying such emphasis.

1. Describe the State's program priorities to expand vocational and technical education for high school students for the current year. (Relate to manpower needs and employment opportunities in Item 1, Part A, above.)

   a. New teaching personnel requirements.

   b. New or additional occupational fields to be provided for.

   c. Plans for replacement or purchase of new equipment.

   d. Plans for improving facilities.

2. Describe the State's program priorities to expand vocational and technical education for post high school students for the current year. (Relate to manpower needs and employment opportunities in Item 1, Part A, above.)

   a. New teaching personnel requirements.

   b. New or additional occupational fields to be provided for.

   c. Plans for replacement or purchase of new equipment.

   d. Plans for improving facilities.

3. Describe the State's program priorities to expand vocational and technical education for persons who have already entered the labor market for the current year. (Relate to manpower needs and employment opportunities in Item 1, Part A, above.)

   a. New teaching personnel requirements.

   b. New or additional occupational fields to be provided for.

   c. Plans for replacement or purchase of new equipment.

   d. Plans for improving facilities.

4. Describe the State's program priorities to expand vocational and technical education for persons with special needs for the current year. (Relate to manpower needs and employment opportunities in Item 1, Part A, above.)

   a. New teaching personnel requirements.

   b. New or additional occupational fields to be provided for.

c. Plans for replacement or purchase of new equipment.

d. Plans for improving facilities.

5. Describe the State's plans for the construction of area vocational education schools during the current year by

   a. Number and types of schools (in terms of section 8(2) of the 1963 Act).

   b. Educational level of program to be offered.

   c. Occupational fields to be provided for.

   d. Location and area (school district(s), county(ies), Statewide) to be served by the school.

   e. Relating this to Item 3, Part A.

6. Describe the State's current year plans for strengthening programs of

   a. Administration and supervision (State and local).

   b. Teacher training.

   c. Vocational guidance programs and services (State and local).

   d. Curriculum development.

   e. Research, experimental, and developmental programs.

   f. Evaluation of programs and activities.

VT 004 850
Industrial Arts Facilities.

Georgia State Dept. of Education, Atlanta
MF AVAILABLE IN VT-ERIC SET.
Pub Date - 67 15p.; Roughdraft, a section taken from "Guide for Planning and Construction of School Facilities in Georgia," August, 1967.

*INDUSTRIAL ARTS LABORATORIES; *SCHOOL PLANNING; EQUIPMENT STANDARDS; *BUILDING DESIGN; *FACILITY GUIDELINES; JUNIOR HIGH SCHOOLS; SENIOR HIGH SCHOOLS

General bases for facilities planning include course organization, program objectives, school organization, and school size. The number of shops necessary are based on grade level, enrollment, and periods of required course work. Guidelines are included which cover: (1) size, shape, and location, (2) walls, floors, and ceilings, (3) windows and doors, (4) illumination and painting, (5) equipment, and (6) utilities and heating. A suggested floor plan and an equipment list is included. (EM)

INDUSTRIAL ARTS FACILITIES

Industrial Arts is a planned program of educational experiences requiring special facilities. The terms unit, limited general and comprehensive general are used to describe three major types of shop organization, housed in these facilities.

Bases for Facility Selection

The organization of each industrial arts shop (including classrooms, drafting rooms and laboratories) is influenced directly by the nature of the instruction and the stated objectives of the program. If the major objective is to provide a broad, industrial-technical exploratory type of program with emphasis on basic experiences and understanding related to industry, the shop should provide for experiences in several industrial arts instructional areas, the facility is organized as a comprehensive general shop. When the major objective is to provide a more concentrated emphasis, the course content is limited to a single area (such as general drafting) of industrial arts. A facility organized for instruction in a single general instructional area is a limited general shop.

At the high school level, a school in a small community that does not have sufficient enrollment to justify a series of limited general shops, it is more feasible to provide a comprehensive general shop. In larger high schools, the industrial arts facilities should consist of several limited general shops.

Comprehensive General Shop

A comprehensive general shop is organized and equipped to provide industrial-technical experiences which have been selected from a variety of activities in two or more instructional areas of industrial arts. The comprehensive general shop should have provisions for instruction in several areas such as drafting, electricity-electronics, metals, woods, power, and graphic arts.

The Limited General Shop

An industrial arts shop organized and equipped to provide instruction in two or more subareas of a single industrial arts instructional area is the limited general shop. As an example, a limited general shop in the area of graphic arts includes subareas such as bookbinding, linoleum block printing and offset printing.

The Unit Shop

An industrial arts shop organized and equipped for a single subarea of instruction such as cabinetmaking, machine shop or sheet metal is the unit shop. The major function of this type of organization is to provide a concentration in one industrial arts

subarea. Note: This facility is generally not recommended in Georgia except as a part of the limited general shop or the comprehensive shop.

School Organization

Junior High School - This type of school should contain one or more laboratory units providing for, at least, four of six areas of instruction (drafting, woods, metals, electricity, power, graphic arts). The instruction can be organized either in one laboratory or divided between or among two or more laboratories. When two or more laboratories are available, the pupils are scheduled through these laboratories to complete the industrial arts exploratory course (general industrial arts).

Senior High School - These schools are usually large enough to require two or more laboratory facilities. Frequently, more than four laboratory facilities are provided in large cities. A department with only two laboratory facilities should have each laboratory equipped for two areas of instruction and a four facility department would have each equipped for one instructional area. These instructional areas are general area courses which provide depth instruction as well as special courses in industrial arts education.

Junior-Senior High School - This type of school may include one or more laboratory units which are used for both junior and senior high school courses. A small school with a minimum laboratory and one teacher should be equipped for the general industrial arts course which provides for at least four of six areas of instruction (drafting, woods, metals, electricity, power, and graphic arts). The minimum facility should also be designed and provide for at least one of the general area courses such as general drafting, general metal, etc. The adjoining planning-drafting room should be of sufficient size (850 square feet minimum) to accommodate equipment and drafting desk for a general course in drafting.

In larger schools where two or more laboratories are required, four to six of the basic areas of instruction described for the minimum laboratory should be organized among these laboratories. These facilities should also provide for three or more general area courses.

Number of Shops Needed

Basic assumption used in determining the number of laboratory units needed are:

Grades 7 and 8:

24 pupils per class (maximum)
5 periods per week for 18 weeks (grade 7 and 8) or
5 periods per week for 36 weeks (grade 8)

Grades 9-12:

24 pupils per class (maximum)
5 periods per week for 36 weeks

Grade 9: 30% of the pupils (60% of boys) enrolled
Grades 10-12: 15% of the pupils (30% of boys) enrolled

Typical problem: How many laboratory units will be required for a junior-senior high school with an enrollment of 900 pupils in grades 7-12?

Grade	Number Pupils	Number Boys		Number Classes
7	200	100		5 (18 weeks)
8	200	100		5 (18 weeks)
			Number in Shop	
9	200X	30%	60	3
10-12	300X	15%	45	2

Total Number of Periods: 10 (2 laboratory units required).

The following recommendations and facility layout are intended as a guide to planning industrial arts facilities.

A. Size, Shape and Location

Total minimum floor area for shop laboratories, drafting rooms, classrooms, storage and finishing areas should be not less than 3,500 square feet. Of this total area, not less than 2,200 square feet should be used as a shop laboratory. A drafting room and electricity-electronics room should have not less than 850 square feet in each space.

Shop laboratories should be located on or above ground level and the floor space of shop laboratories should be on one level. Shop laboratories should be located where noise will cause the least interference to the rest of the school. A wing of the main building or a separate building near the main building is preferred.

A laboratory area, square or rectangular in shape, not exceeding a ratio of 1 to 2 is best. Avoid recessed areas, "L" and "T" shapes. All parts of the shop should be visible to the instructor.

Ceiling height should be at least 10 feet in laboratories (shops) when dust collectors are provided for wood machines; at least 12 feet without dust collectors.

The shop should not be a passage-way to other rooms. Each shop should be an integral unit.

The facilities should be designed so that additional laboratories, drafting rooms and classrooms could be added with a minimum of expense.

B. Walls, Floors and Ceilings

Drafting, planning and electricity-electronics room floors should be covered with tile. It is recommended that shop laboratory floors be covered with a non-skid tile. Colored concrete floors are generally satisfactory if finished smooth, hardened and sealed.

Conduit for machines should be laid before the floor is poured and allowed to terminate flush with the floor level with covered outlets at predetermined machine locations. Wall raceways containing 220-V 3 phase, 220-V single phase, and 110-V service should be provided as they permit flexibility in organizing or relocating machines and should provide sufficient power so that all machines can be operated at one time. Every outlet should be a grounded outlet. A magnetic control switch should be located for easy access - preferably near the office. This should be a part of the control system. Each machine circuit should be individually protected with a circuit breaker.

Walls should have a smooth finish. A wainscoating approximately 48" high and of a durable nature should be provided.

Provide glass (transparent) panels in partitions between shops and auxiliary rooms. Safety glass with wire mesh located in doors to auxiliary spaces will be satisfactory.

Partition walls should be non-bearing walls ceiling height, and of a semi-permanent construction to permit future alterations in floor plan.

Ceiling should be acoustically treated, or possess sound-absorbing qualities.

C. Windows and Doors

Window area should be approximately 20% of floor area. Use sash of the awning type when possible.

Windows should extend to the ceiling from a point 5' to 7' above the floor to permit more effective use of wall space. Where activities outside the building might interfere with shop classes, window sills should be above eye level. Select a northern exposure. Prismatic skylights, oriented northward, are effective.

Sunlight must be controlled, preferably before entering the shop, by means of overhanging roof or louvered reflectors. This is especially important in warm climates. Make provision for darkening certain areas for use of films and TV.

Provide only one door as the regular means of pupil entrance. Shops should have a 5'-6' double door, opening onto a service drive. Door locks within a shop should have a master key.

D. Illumination and Painting

A minimum of 30 feet candles at bench height should be provided in shops and a minimum of 50 feet candles in drafting and electricity-electronics laboratories. Local lighting should be provided where necessary. Secure the advice of lighting experts.

Semi-direct types of fixtures are satisfactory for shops. Diffused light is preferred. Fluorescent lighting used in and near an electronics shop should be furnished with a radiation filter to prevent interference with electronic equipment.

Light switches should be located near the main entrance to shops and drafting rooms. The lighting circuit should be separate from circuits for machines and wall convenience outlets.

Ceilings and walls should be painted with a flat, high reflection factor paint. Ceiling should be white with a reflection factor of 85% or above. Upper walls should be of a suitable color and with a reflection factor of 60%. Wainscoating should have a reflection factor 40 - 60%. Equipment in the shop should be painted to carry out a color scheme. Color schemes are available from paint manufacturers.

E. Equipment

Provide aisles of travel to commonly used areas. Insure that ample space exists around equipment, but do not distort the most effective arrangement for the occasional extra large piece. Locate machines so that operational procedures do not endanger others.

Machines used in sequential order should be arranged in the order of their operation. Machines should be mounted on celotex or leather and bolted to the floor sufficiently to keep them in position.

Locate the most frequently used equipment near the center of operation. Cut-off saws for wood and metal should be located near the storage rooms. Within a shop, locate related areas together, i.e., welding, forging, foundry, etc.

Utilize naturally lighted areas for precision equipment such as lathes, drawing tables, grinders, saws, etc., and consider direction of light with reference to operator position.

Allow sufficient floor space for assembly and demonstration areas.

Provide dust and shaving collectors for machines and exhausts for gases and fumes. Glazed terra-cotta tile, under the floor, works well. Shaving collectors should be outside of the shop.

Electrical service to machines should be controlled from a panel conveniently located in the shop. Extra circuit breakers should be provided for future additions.

Tools and equipment should be purchased with the sizes of the pupils in mind. Purchase high quality equipment, preferably of medium rather than light weight. Purchase only self-contained machines; not combination machines. Never run two or more machines from the same motor.

Planning and library centers should be located in an auxiliary room separated from the work area by a glass partition. Lighted display cabinets or cases should be provided outside of, but near the working area of the shop.

Lumber and metal bar stock, band iron, etc., may be stored in vertical bins with a resulting economy of space. Consider standard sizes of materials when planning storage.

F. Other Considerations

Provide adequate storage space for student projects, supplies. Provide adequate chalkboard and bulletin board space.

Provide a four station wash area, goose neck fixtures, with hot and cold water in each shop lab. Provide drinking fountain and slop sink in shop area. Provide toilets if building is detached from other school building.

Water, gas, and compressed air (80 - 100 lbs.) should be provided. Air compressors should be located outside the shop area and at least 25' from the nearest spray painting outlet. Air lines should pitch back to the compressor. Provide finishing room with dry type spray booth and regulated compressed air.

Locate convenience outlets in the walls of the shop at 10-12' intervals and at work benches. Wall outlets should be 42" above the floor. Outlets for soldering irons and other heating devices should be equipped with pilot lights.

Unit type heaters mounted near the ceilings are generally suitable. Heating and cooling controls for shops should be separate from the central control system for the rest of the school. Air conditioning should be provided, if not, provide fans of sufficient

size to properly ventilate the facilities. The fans may be located in the ceiling or on an outside wall.

A sounding unit of the school fire alarm and period change systems should be installed in each shop. Provide appropriate fire extinguishers and first aid cabinets.

Provision should be made for storage of cleaning equipment on an organized basis.

A signal bell operated independently in the shop laboratory should be provided.

G. Planning Individual Laboratories

When the kind of laboratory facilities has been determined, the detailed floor plan and equipment locations should be developed. This planning should be a joint effort by the principal, industrial arts teacher, local supervisor, architect, and industrial arts consultant of the State Department of Education.

MINIMUM INDUSTRIAL ARTS FACILITY FOR SCHOOL ENROLLMENT OF 750

RECOMMENDED LAYOUT

EQUIPMENT INDEX FOR INDUSTRIAL ARTS FACILITY

1. Desk, teacher.
2. Layout table.
3. Tracing table.
4. Drafting tables, dual type with storage, if tables without storage are purchased additional storage cabinets will be needed in rear of room.
5. Stools, drafting.
6. Sink enclosed with storage cabinets below and work surface above for reproduction equipment. 110-V outlet 36" above floor level.
7. Chalkboard, 16 ft., bottom located at least 36" from floor level.
8. Tack board, 16 ft., bottom located at least 40" above floor level.
9. File cabinet, legal size.
10. Electrical tables with storage below and power supply mounted on top, 110-V electrical connection in floor for each.
11. House and industrial electrical work area, locker storage below, three 110-V outlets 36" above floor level, one 220-V outlet.
12. Tool panel, electrical tools.
13. Fire extinguisher, appropriate type as located.
14. Small motors work surface with storage cabinets below, 110-V outlets 36" above floor level along the wall.
15. Electroplating work area, 110-V outlets, 36" above floor level.
16. Electronics test area with storage cabinets below, four 110-V duplex outlets along wall 36" above floor, one 220-V outlet 36" above floor.
17. Demonstration panel, 110-V outlets 36" above floor level.
18. Coat rack with book storage shelf above.
19. Display case with glass front and light inside, outlet needed.
20. Water fountain, 110-V outlet.
21. Chalkboard, 8 ft., 36" above floor level.
22. Wash area, with four wash faucets with hot and cold water, storage below for janitor supplies.
23. Tack board, 4 ft. long, 36" above floor level.
24. Planning table.
25. Book shelves.
26. Finishing area complete with spray booth, compressed air outlet, exhaust fan and hood, and work surface. Location of finishing room may be relocated after consulting the State Consultant for Industrial Arts, State Department of Education.
27. Exhaust fans located high on the wall (May be located in roof) are required for ventilation if facility is not air conditioned.
28. Broom rack with trash can below, provided in locations as shown on plan.
29. Metal spinning lathe, 220-V, 3 ph.
30. Metal lathe, 220-V, 3 ph.
31. Milling machine, 220-V, 3 ph.

32. Soldering table, three 110-V outlets 36" above wall.
33. Spot welder, 220-V 3 ph outlet 36" above floor level.
34. Gas furnace, provide natural gas outlet and 110-V outlet.
35. Foundry work ben.
36. Furnace, curcible, provide natural gas outlet and 110-V outlet.
37. Heat treating furnace, provide natural gas outlet.
38. Welding table for arc welder, 220-V outlet in back wall, provide exhaust fan and hood over welding area.
39. Welding table, gas, provide exhaust and hood above welding area.
40. Power mechanics work area, three110-V outlets 36" above floor level.
41. Work table, metal, 42" X 96" with 2 stake plants, lockers below.
42. Work bench, metal, 42" X 96" with storage shelves below for sheet metal, and combination mach, bar folder, and finger brake mounted on top.
43. Drill press, 220-V, 3 ph.
44. Metal shaper, 220-V, 3 ph.
45. Power hacksaw, 220-V, 3 ph.
46. Squaring shear, no power needed.
47. Grinder, 220-V, 3 ph.
48. Work bench, 36" X 6 ft., with lockers below.
49. Slip form roll, floor mounted.
50. Tool panel, for metal working tools, lock type.
51. 4 Station wood work bench, complete with 4 vises, storage lockers below, provide 110-V outlet dropped from above table to 4 ft. above floor line.
52. Wood shaper, 220-V, 3 ph. connect to dust and chip system.
53. Belt and disc sander, 220-V, 3 ph, connect to dust collector system.
54. Bandsaw, 220-V, 3 ph, connect to dust and chip system.
55. Overarm saw, 220-V, 3 ph, connect to dust and chip system.
56. Tilting arbor saw, max. size 10", 220-V, 3 ph, connect to dust and chip system.
57. Wood surfacer, 220-V, 3 ph, connect to dust and chip system.
58. Jointer, 6-8", 220-V, 3 ph, connect to dust and chip system.
59. Lumber rack, vertical.
60. Wood lathe, 220-V, 3 ph, connect to dust and chip system.
61. Jig saw, 110-V, connect to dust and chip system.
62. Portable glue table.
63. Clamp rock.
64. Tool storage, woodworking tools, lock type.
65. Recommended location for power panels, may be relocated.
66. First aid cabinet.
67. Dust and chip collector unit, provide adequate wiring for unit installed may be relocated.
68. Air compressor, provide adequate wiring for unit installed, may be relocated, pipe air to finishing room and provide at least one additional outlet in shop area as marked.
69. Floor openings for dust collector system for cleaning floor. Make provisions for closing and opening hole.
70. Clock outlet, 8 ft. above floor level or other appropriate location.
71. Location for push button for clean up buzzer. Clean up buzzer should be located on inside wall directly above switch.

72. Storage racks for power mechanic parts, etc.
73. Metal bender.
74. Electrical table stools.
75. Teachers' coat rack.
76. Storage cabinets, small supplies.
77. Mirror, bottom 48" above floor.

Notes:
(1) Windows are not shown in plan since size and type will depend on architectural design. Window sills should be from 5-7 ft. above floor level.
(2) Exhaust pipes for dust and chip collector should be under floor.
(3) Office and small storage rooms can be deleted and toilets added in this space if unit is detached.
(4) Skylights may be used for natural light in shop laboratory.
(5) Doors opening into laboratory should have polished wire glass in upper half of door.

*OCCUPATIONAL SURVEYS; *LABOR MARKET; LABOR FORCE; *MANPOWER UTILIZATION; SKILLED OCCUPATIONS; SEMISKILLED OCCUPATIONS; UNSKILLED OCCUPATIONS; EMPLOYMENT PATTERNS; EMPLOYMENT PROJECTIONS; EMPLOYMENT TRENDS
*TIRE AND TUBE INDUSTRY

This survey is one of a series of manpower studies designed to provide the United States Employment Service (USES) and its affiliated state employment services with labor market information needed to carry out operating responsibilities. A survey of 46 individual establishments in the tire and inner tube industry was made to ascertain the role of manpower in the industry. Increased mechanization has contributed to rising production and declining employment. The industry's principal employment center is the North Central region, with Ohio alone employing 46 percent of the industry workers. Shortage occupations have remained virtually non-existent with only a few job openings for highly qualified professional and skilled workers. Tire tube workers, among the highest paid industrial workers, received an average hourly wage of $3.25 in 1963, compared to an average of $2.46 per hour for all manufacturing workers. Although the industry's employment dropped between March 1963 and January 1964 by an estimated 2,600, or 3 percent, the decline was not sufficient to cause changes in the classifications of the industry's principal area of employment. On the other hand, should a significant downturn occur in the industry, the smaller geographic areas in which tire employment is a major portion of the labor force could be in serious trouble. (HC)

INDUSTRY MANPOWER SURVEYS No. 107

TIRES and TUBES

Labor Market Developments

U.S. DEPARTMENT OF LABOR
MANPOWER ADMINISTRATION
BUREAU OF EMPLOYMENT SECURITY

TIRES AND TUBES

Foreword

The industry covered by this survey is defined as Tires and Inner Tubes, Standard Industrial Classification Code 3011. The analysis is based in part on 46 individual establishment reports gathered by local offices of State agencies affiliated with the Bureau of Employment Security. The reporting units accounted for most of the industry's total employment.

The major purpose of this survey is to provide the public employment service system with labor market information needed to carry out its operating responsibilities. These include guidance and counseling, determination of job shortage, job development, impact of industry trends on area employment, development of more effective employer relations, evaluation of training programs as they affect displaced industry workers, and local area impact of imports for implementation of the Trade Expansion Act.

In addition, these industry statements provide information for discharging the responsibilities of the United States Employment Service at the national level for the Congress; for working with the Surplus Manpower Committee of the Office of Emergency Planning, the Department of Defense, and other Government agencies; and for replying to informational requests from numerous private sources.

The analysis was prepared by Kenneth D. Bell, under the direction of Norman Medvin, Chief, Branch of Skill and Industry Surveys, Office of Manpower Analysis and Utilization of the United States Employment Service.

TIRES and TUBES

March 1964

HIGHLIGHTS

Increased mechanization spurred by extensive capital outlays has contributed to rising production and declining employment in the tires and tubes industry, according to a recent survey of the United States Employment Service and its affiliated State agencies. Per employee expenditures for new plant and equipment in this industry were more than double the comparable expenditure for manufacturing industries as a whole.

Increased technological improvements have affected manpower requirements in virtually every phase of the industry's operations. As a consequence the number of production workers since 1955 has decreased by almost 22,000, despite a significant increase in tire production. Nonproduction workers also declined in the same period, but at a much slower rate.

Recent industry layoffs did not contribute substantially to serious labor surpluses since the principal layoffs were relatively small and occurred in major labor market areas. Moreover, industry employment registered gains in almost all of the small areas having substantial or substantial and persistent unemployment.

The industry's principal employment center is the North Central region with 64 percent of the 96,000 workers in establishments covered in a special Employment Service survey of this industry conducted about a year ago. Among the individual States, Ohio alone employed 46 percent of the industry's workers. About three-fourths of the industry's employment was in 18 major labor market areas of the Nation with Akron accounting for 55 percent of the 18-area total of 73,900.

Regional distribution of the industry's workers has been shifting in favor of the South. Between March 1952 and March 1963 employment increased 12 percent in the South while in the North Central and West, employment declined, respectively, 23 percent and 27 percent. A slightly lower decline of about 18 percent was reported for the Northeast.

Shortage occupations have remained virtually non-existent. A few job openings, however, were reported for highly qualified professional and skilled workers. Difficulty in filling these positions was generally attributed to national shortages or rigid job specifications.

Although changing technology has reduced the physical requirements for many plant operations, employment opportunities for women have remained limited. Of the industry's total workers, only 13 percent are women,

compared to 32 percent in other rubber products, and 37 percent for all non-durable goods industries. In the past four years, the number of female workers in the industry declined about 18 percent, from 15,200 in 1959 to 12,500 in 1963.

The industry's production workers are among the highest paid of the Nation's factory workers. For 1963, tire and tube workers received an average hourly wage of $3.25, compared to an average of $2.46 per hour for all manufacturing workers. As a result of higher hourly earnings, the average weekly wage for tire and tube workers during 1963 amounted to $131.30--about $34.00 higher than that paid by manufacturers of other rubber products and close to $32.00 more than the average weekly wage paid to all manufacturing workers.

FIRST TRIP - A continuous conveyor carries just-cured tires from the curing presses. The double row of tires just behind the presses, or molds, are going through an inflation period to complete the curing process.

Output Rises

The tires and tubes industry has been characterized by declining employment, rising production, and increased technology over a period spanning at least the last decade. Since 1955, the industry's employment declined nearly 23,000, or 19 percent, to an average of about 96,000 in 1963 (table 1). The relative decline in man-hours was even greater because of a reduction in the length of the workweek.

Despite the overall employment decline, the Federal Reserve index of tire and inner tube production increased over 20 percent between 1955 and 1963 (table A, Appendix). Most of the increase came from passenger tires, which rose more than 24 percent. The 1963 boom year in the automobile industry pushed shipments of original equipment tires for passenger cars alone to

almost 42.0 million units, the highest since 1955. With motorists setting new travel records, demand also continued strong for passenger car replacement tires. Production of truck and bus tires continued upward, reaching an index of 122.0 in 1963--the highest for any year since the Korean War.

Emphasis upon modernization of plant and equipment is shown by the amount of new capital invested over past years. Between 1951 and 1962, new capital expenditures increased almost 90 percent--from $58.0 million to $110.2 million annually (table B, Appendix). The 1962 expenditure represented an investment of $1,275 per employee, more than double the comparable average for 1951. Moreover, the per employee capital expenditure increase in the tires and tubes industry between 1951 and 1962 was more than four times that for manufacturing as a whole.

Technological innovations, arising from increased expenditures, have affected manpower requirements in virtually every phase of the industry's operations--from receiving and storing of raw materials to warehousing and storing of the finished product. Despite the problems posed by variations in the types of tires as well as in processing materials, particularly in the tire building phase, completely automatic tire building machines have, nevertheless, been installed in some plants. Semi-automatic tire curing equipment and continuous conveyor systems have reduced unit labor time in curing operations (see illustrations pages 3 and 9). New tire testing equipment and facilities have also been introduced. In addition, a fully automatic, electronic system for retreading car and truck tires may be used in larger plants where the volume of production justifies the cost of such equipment. Also in the line of product development, changes such as the reduction in the number of plys from four to two increases quality while reducing labor requirements.

Increased mechanization and plant modernization has had a significant effect upon output per man-hour in the tires and tubes industry. Between 1955 and 1960, output per employee man-hour rose 25 percent, while output per man-hour of production workers increased about 30 percent according to the Bureau of Labor Statistics (table C, Appendix). Estimates through 1962 indicate further increases in output per man-hour since 1960--amounting to about 14 percent for all employees and 13 percent for production workers. Reflecting this rise in productivity, the number of production workers declined almost 22,000, or 24 percent, between 1955 and 1963. At the beginning of this period, over 76 percent of the industry's workforce were production workers; by 1963 the proportion had dropped to 72 percent. This relative decline was in line with the employment trend for manufacturing activities as a whole, where the production worker segment represented a drop of 5 percentage points--from 79 percent in 1955 to 74 percent in 1963.

Concerned by the impact of changing technology and other problems affecting employment and worker status, the United Rubber, Cork, Linoleum and Plastic Workers Union has proposed the establishment of company-wide joint-study committees to be composed of union and management members. The purpose of these committees would be to study problems of mutual interest to both union and management. Major rubber companies have concurred in the merits of the proposal, and as of early May 1964, it was expected that such committees would be established soon.

Imports a Minor Influence

American tire exports have consistently exceeded the value of imports by a ratio of more than three to one. In 1962, U. S. exports were valued at $78 million compared to imports of $24 million. The value of imports was very small--less than 1 percent--in terms of total domestic tire shipments which amounted to $2.4 billion in 1962 (table D, Appendix).

In addition to tariffs and other trade restrictions, low exports reflect the fact that American-owned plants and sales outlets around the world supply a large segment of the foreign market. Presently, 92 of the 112 tire plants outside the United States and the Soviet bloc are owned by or affiliated with U. S. tire companies, according to the Business and Defense Services Administration of the Department of Commerce.

Although domestic sales of foreign cars have increased in recent years, tire imports have remained relatively low. This can be explained by the fact that American tire manufacturers have begun to produce tires for foreign automobiles, and also because some tires produced for domestic cars are interchangeable with foreign models.

Ohio Loses, South Gains Employment

The regional distribution of tire and tube workers has been shifting in favor of the South, where tire producers are closer to their sources of raw materials and expanding markets. Between March 1952 and March 1963 employment increased 12 percent in the South, while in the North Central and West, employment declined, respectively, 23 percent and 27 percent. A slightly lower decline of about 18 percent was reported for the Northeast.

Despite the shift, however, over 60 percent of the industry's employment in 1963 was in the North Central States, with Ohio alone accounting for 44 percent of the Nation's total tire and tube workers (table 2). The South employed 19 percent of the industry's workforce while the Northeast and West employed 12 percent and 8 percent, respectively.

About four-fifths of the surveyed employment was located in seven States: Alabama, California, Iowa, Michigan, Ohio, Pennsylvania, and Tennessee.

Recent Layoffs in Areas of Heavy Unemployment

About three-fourths of the Nation's 96,000 tire and tube workers in surveyed establishments were employed in 18 major labor market areas in March 1963, with Akron, the principal industry center, representing approximately 55 percent of the 18-area total. Other important areas include: Los Angeles-Long Beach, Detroit, Philadelphia, Des Moines, and Memphis; however, the combined employment of these five areas was only about half the 40,500 tire and tube workers employed in Akron plants.

Although the industry's employment dropped between March 1963 and January 1964 by an estimated 2,600, or 3 percent, the decline was not sufficient to cause changes in the classifications of the industry's principal areas of employment. The majority of tire and tube workers continued to be employed in areas of relatively low or moderate labor surplus, including the Akron area where the industry's workforce also declined about 3 percent in the corresponding period.

The industry's layoffs during the 12 months ending March 1963 did not create a serious manpower surplus, primarily because the principal layoffs were relatively small and occurred in major labor market areas (table 3). Nevertheless, it is of interest that the bulk of the decline in tire and tube employment, small as it was, took place in those major areas least able to afford it, that is, those with already heavy unemployment. Fortunately, in the smaller and very small labor market areas, where there is substantial or substantial and persistent unemployment, the number of tire and tube workers actually increased during the year ending March 1963.

On the other hand, should a significant downturn occur in the tire and tube industry, the smaller areas in which tire employment constitutes a major portion of the area's labor force could be in serious trouble. Similarly, a sharp downturn in Akron, where tire and tube workers dominate the area's economy, could have serious implications.

Few Firms Report Occupational Shortages

Few surveyed establishments are experiencing manpower recruitment difficulties, primarily because of the large number of workers on lay-off status who are subject to recall as needs arise. As a result, the total number of occupational shortages is insignificant. Only eight firms expressed difficulty in finding a limited number of qualified job applicants, particularly in professional occupations such as engineering and chemistry. Difficulty in filling these positions was generally attributed to national shortages. Other hard-to-fill openings, confined to one or two plants, included journeymen tool and die makers, pipefitters, and maintenance machinists and mechanics.

Table 3.--Employment in Tires and Inner Tubes Establishments in Selected Labor Market Areas March 1962 and March 1963

GREEN TIRES - A "green," or uncured tire is loaded on a semi-automatic tire press. As the curing time is completed, the finished tire is ejected from the back of the press and one of the green tires is inserted for the next cycle.

Photo Courtesy of Goodyear Tire and Rubber Company

Production workers are generally hired at the unskilled level and promoted through on-the-job training. Recruitment is frequently conducted at the gate or through recommendations of present employees. State employment security agencies placed 17 percent of all new employees in surveyed establishments in a single month in 1963. Many plants require applicants for production jobs to meet rigid qualifications, including a strict physical examination, as well as height, weight, and age specifications. Some companies also require prospective production workers to pass manual dexterity tests.

Although changing technology has reduced the physical requirements for many plant operations, employment of female workers has remained limited. Of the industry's total employment, only 13 percent are women, compared to 32 percent in plants producing other rubber products, and 37 percent for all non-durable goods industries. In addition, the number of women employed in tires and tubes plants has declined both in number and as a percentage of total employment. In 1959 the industry employed 15,200 female workers--representing about 15 percent of total employment; by the end of 1963, women had declined in number to 12,500, or some 13 percent of total employment.

Industry's Workers Among Highest Paid in Nation

The industry's production workers are among the highest paid of the Nation's factory workers. For 1963 tire and tube workers received an average hourly wage of $3.25, compared to an average of $2.46 per hour for all manufacturing workers (table E, Appendix). As a result of higher hourly earnings, the average weekly wage for tire and tube workers during 1963 amounted to $131.30--nearly $32.00 above the comparable wage for all manufacturing workers. During the past six years, 1957-1963, production workers in tires and tubes received an average increase of 23 percent, including premium pay, for a week's work, compared to an average rise of 22 percent for all manufacturing workers.

More than half the firms surveyed by State employment security agencies in March 1963 were offering an entry wage rate of at least $1.95 per hour for male workers (table F, Appendix). Firms located in the Northeast and North Central regions generally reported higher entry wages than plants in other areas; between 70 to 80 percent of the plants offered at least $1.95 per hour. In the West, half of the firms had an entry wage of $1.95 per hour or higher. Plants throughout the South generally offered the lowest entry rates, with less than one-third of the reporting establishments offering $1.95 per hour or more.

*SALES OCCUPATIONS; *DEPARTMENT STORES; *EMPLOYMENT OPPORTUNITIES; EMPLOYMENT PATTERNS; *EMPLOYMENT TRENDS; *OCCUPATIONAL SURVEYS; LABOR FORCE; WAGES

The purpose of this survey was to provide the public employment service system with labor market information needed to carry out guidance, determination of job shortages, job development, industry trends, more effective employer relations, and evaluation of training programs. The 1,455 units surveyed, each employing 100 or more workers, had an aggregate employment of 692,900, about 74 percent of the industry total employment. From 1958 to 1963 department store employment grew at 13.3 percent compared to 10.0 percent for other retail employment. The average work force of close to 1 million in 1963, or one out of every nine workers in retail trades makes department stores one of the nation's principal employers, and still, more than one-fourth of the reporting establishments indicated some difficulty in filling job vacancies, particularly for skilled positions. The movement of department stores to the suburbs has increased the need for part-time sales personnel. Department stores have kept pace with competitors with a 62.4 percent volume increase between 1954-1963 compared to a 44.6 percent increase for other retail establishments. Average hourly earnings of non-supervisory department workers rose 20.3 percent to $1.72 from 1958 to 1963. (MM)

DEPARTMENT STORES

Foreword

The industry covered by this survey is defined as Department Stores, 1957 Standard Industrial Classification Code 5311.

The analysis is based in part on individual establishment reports gathered by local offices of State employment security agencies affiliated with the Bureau of Employment Security. The 1,455 units surveyed--each employing 100 or more workers--had an aggregate employment of 692,900, about 74 percent of the industry's total employment.

The major purpose of this survey is to provide the public employment service system with labor market information needed to carry out its operating responsibilities. These include guidance and counseling, determination of job shortages, job development, impact of industry trends on area employment, development of more effective employer relations, evaluation of training programs as they affect displaced industry workers, and local area impact of imports for implementation of the Trade Expansion Act.

In addition, these industry statements provide information for discharging the responsibilities of the United States Employment Service at the national level for the Congress, work with the Surplus Manpower Committee of the Office of Emergency Planning, the Department of Defense and other Government agencies, and informational requests from numerous private sources.

The report was prepared by Ernest F. Schroeder, under the direction of Norman Medvin, Chief, Branch of Skill and Industry Surveys, Office of Manpower Analysis and Utilization of the United States Employment Service.

HIGHLIGHTS

Expanding department store activities provide a broad range of job opportunities, according to a nationwide department store survey conducted by the United States Employment Service. From 1958 to 1963, department store employment grew at a faster rate than other retail employment--13.3 percent compared to 10.0 percent. With an average work force now close to 1 million, department stores employ one out of every nine workers in retail trades and constitute one of the Nation's principal employers.

The traditional department store is meeting the challenge of changing times by adopting widespread changes in organization and operation. This is reflected in the merger of some department store establishments, the opening of branch stores of various sizes and types in suburban areas, the introduction of automation in accounting and inventory systems, and changes in lines of merchandise. In addition, stores are remaining open longer and emphasizing self-service in some departments.

More than one in every four department store workers (29 percent) were employed in three States--California, Illinois and New York--as of March 1963. In addition, more than two-thirds of the 693,000 workers in department store establishments surveyed as part of the special USES State employment service study were concentrated in 39 major labor market areas.

Nationwide, 7 out of 10 department store employees in recent years have been women. For retail employment exclusive of department stores, women constituted fewer than 4 out of every 10 workers. Regionally, there was only a small variation in the proportion of women in surveyed department stores--from 66 percent in the South to 71 percent in the North Central States.

As might be expected because of the increasing participation of women in sales and clerical positions, especially on a part-time basis, a larger proportion of women than men department store workers were employed less than 35 hours. Relatively more women worked less than 35 hours in the Northeast while in the South relatively more women worked 40 or more hours.

More than one-fourth of the reporting establishments indicated some difficulty in filling job vacancies. The most frequent job openings were for experienced sales persons, particularly in such areas as apparel, shoes, and home furnishings. Other occupations for which some establishments reported difficulty in recruiting workers were: Tailor and seamstress, commercial artist and displayman, and department manager.

Department Store Employment Continues to Rise

Department store employment in 1963 rose 2 percent or 20,000 above the 1962 level to a new high of 980,000. Even further gains are anticipated in 1964.

During the period 1958-1963 about one out of every nine employees in the retail trades had a department store job (table 1). Among department store workers, there has been virtually no change in the proportion employed in the larger stores in recent years. In March 1963 as in March 1959, 60 percent of all department store employment covered by State unemployment insurance laws was in establishments with 500 or more workers. These firms, moreover, constituted only 7 percent of all department stores in each of the years (table 2).

The Changing Pattern in Department Store Merchandising

In the past decade or so, developments in the field of merchandising have resulted in major innovations in department store and other retail sales operations. Supermarkets have expanded into the general merchandising field, mail order houses are increasing their general retail merchandise outlets, "discount-department stores" have gained wide acceptance, and variety chains are broadening the scope of their activities. As a result of this shifting pattern in retail merchandising, the line of demarcation in determining what constitutes a department store sometimes becomes blurred.

Source: Bureau of Labor Statistics.

Prior to World War II, the typical department store was located in the downtown area and was dependent upon downtown business. As the city grew, so did the department store. The store was frequently a middle-class merchandising institution which enjoyed then, as at present, considerable prestige and a reputation for reliability. The great attraction of the downtown department store was the availability of a wide selection of merchandise under one roof. In addition, the store was designed to stimulate impulse buying. Contributing greatly to this appeal was the use of spacious areas which frequently became difficult to maintain as costs and competition mounted over the years.

During the postwar period, the old-line department store became subject to increased competition as large segments of the population shifted to the suburbs and new developments in merchandising met wider consumer acceptance. The movement of the population--especially the more affluent--out of the cities to the suburbs resulted in increased patronage of suburban stores with consequent loss of sales in downtown department stores. In addition, the expansion of specialty stores into wider lines of merchandise, the increase of non-food items in supermarkets and the phenomenal growth of the "discount-department store" widened the scope of department store competition.

The movement of department stores to the suburbs has increased the need for part-time sales personnel in the suburban stores as these stores are open later than the downtown stores. As a consequence, the suburban branches tend to have a larger share of part-time workers than the downtown stores. Many of these part-time employees are housewives, students, and other secondary workers. In some instances, where suburban stores are opened in the more remote areas, recruitment problems arise in obtaining personnel because of the inconvenience in traveling.

The peak period in department store sales is usually at mid-day. In their efforts to obtain the necessary sales personnel to meet this peak load, department stores find housewives and other part-time workers can be more readily recruited for the suburban stores than for the downtown stores since such workers live closer to the suburban stores.

While there is a need for more sales help in suburban stores, there is a greater concentration of the administrative staff in the downtown area where the accounting, purchasing, warehousing, and other sales-supporting services are still generally concentrated. Although these functions involve fewer part-time workers, the demand for full-time workers in certain craft and office occupations is strong.

Table 2. Department Store Employment
by Size of Establishment
March 1959-March 1963

Employee-size of establishment	Employment			
	Number		Percent	
	March 1963	March 1959	March 1963	March 1959

Source: U. S. total--Bureau of Labor Statistics; employment size detail estimated by Bureau of Employment Security.

Department Stores Keep Pace with Competition

Despite inroads by other retail competition, department store sales between 1954-1963 increased 62.4 percent, from $10,272 million to $16,683 million, while sales in other retail establishments rose 44.6 percent, from $158,863 million to $229,752 million, according to Department of Commerce data. Between 1958 and 1963, department store sales, adjusted for price increases, rose 27 percent while average annual department employment grew by 13.3 percent. Actually the increase in employment reflects the addition of many part-time workers. If actual man-hours worked are used instead of the gross figure on employment, the disparity between employment and adjusted sales would be even greater.

The traditional department store is meeting the challenge of changing times by adopting greater flexibility in methods of operation. This flexibility is reflected in the merger of some department store establishments, the opening of branch stores of various sizes and types in suburban areas, the introduction of electronic data processing in accounting and inventory systems, as well as in material handling, and changes in the quality, and kinds of merchandise. In

some instances, the quality of merchandise has been upgraded in one company store while at the same time another store of the same company may sell discount items only. In other instances, discount merchandise as well as regular-priced fashion merchandise has been carried under the same roof. There is also an increasing trend to self-service and to remaining open longer.

West Has Largest Gain in Employment

The West experienced by far the largest employment gain while the North Central region lost ground as the principal employment center. Employment in Western States, including Alaska and Hawaii, rose 42,300, or 35.4 percent to 161,700 between March 1958 and March 1963 (table 3). For the North Central States, there was a gain of only 25,400 or 9.8 percent to 283,600. The Northeast and South followed the West with gains of 18.5 and 15.0 percent respectively.

As a result of these shifting regional employment trends, the West accounted for 17.3 percent of the Nation's department store employment in March 1963 compared to 15.0 percent in March 1958 while the North Central region's share during the period declined slightly to 30.4 percent from 32.5 percent. The Northeast and South, however, continued to maintain their relative positions during the period.

Among the 37 States having 4,000 or more department store workers in either March 1963 or March 1958, only five--Arkansas, District of Columbia, Oklahoma, Tennessee, and West Virginia--had declines, and one State--Pennsylvania--experienced no change. Contributing to the decline in the District of Columbia was a sharp growth in population in the Washington suburbs in Virginia and Maryland accompanied by expanding branch stores activities in those outlying areas.

Employment Centered in Larger Metropolitan Areas

The latest data on department store employment by local area are those developed as part of a special survey conducted by the public employment service in October 1962. This survey showed that more than two-thirds of the department store workers covered were located in 39 major labor market areas--each employing 4,000 or more such workers (table 4). The number of surveyed department stores in these areas, however, comprised only 46 percent of the total reporting.

Department store employment in all 39 areas in October 1962 represented 1.8 percent of total nonagricultural employment in these areas. Within the 39 areas, department store employment as a percentage of nonagricultural employment fell within the range of 1.3 percent in New York to 3.4 percent in Fort Worth.

Source: U. S. total--Bureau of Labor Statistics; Regional and State detail--Bureau of Employment Security.

Women Constitute Substantial Proportion of the Department Store Work Force

Seven out of every 10 employees in department stores are women. This compared with about 4 women workers out of every 10 workers in all other retail trades. Regionally there is only a small variation in the proportion of women workers in surveyed stores--from 66 percent in the South to 71 percent in the North Central States. The range in the proportion of women department store workers among the 39 areas varied from about 60 percent in San Antonio and San Diego to over 80 percent in Buffalo and Portland, Oregon.

Relatively More Women Than Men Work Part Time

Almost a third of the Nation's nonsupervisory work force in department stores was, as of June 1962, employed less than 35 hours per week, while over 52 percent worked 40 hours or more (table A, Appendix). The Northeast had the highest proportion of the industry's workers employed less than 35 hours and the smallest proportion of workers with 40 or more hours of work. In contrast, the South reported almost 60 percent of its nonsupervisory workers employed 40 or more hours. Many of those employed on a less than 40 hour weekly work schedule worked short hours by their own choice.

As might be expected because of the increasing participation of women in sales and clerical positions, especially on a part-time basis, a larger proportion of women than men department store workers were employed less than 35 hours. Among women, a higher proportion worked fewer hours in the Northeast than in other regions.

One-Fourth of Establishments Indicate Some Recruitment Problems

More than one-fourth of the reporting establishments indicated some difficulty in filling job vacancies. Although there was a broad range in the kinds of job openings, the most frequent jobs were for experienced sales persons, particularly in such areas as apparel, shoes, and home furnishings. Other workers for which some establishments reported difficulty in recruiting were:

Tailors and seamstresses
Comptometer operators
Secretaries
T. V. repairmen
Commercial artists
Displaymen
Department managers

Table 4. Employment Trends in Reporting Department Store Establishments in 39 Major Labor Market Areas with 4,000 or More Department Store Workers October 1962

1/ Includes only firms reporting total and female employment for October 1962. In all but 5 areas, employment in firms reporting both total and female employment represented at least 90 percent of total employment reported for the area.

Source: State employment security agencies.

New employees are recruited through direct application, public employment offices, friends and relatives, newspaper advertisements, and schools and colleges. High school graduates are preferred for sales clerks but not for all jobs. A neat appearance, tact, and ability to deal with the public are necessary prerequisites for sales positions. College or other special training in salesmanship or merchandising is sometimes required for advancement to buyer or other executive positions. Older workers are frequently hired for part-time employment and for some positions for which specialized experience is required.

Suburban housewives are commonly recruited for part-time employment in nearby department store branches. In the downtown area, the main department store frequently employs part-time workers who have other jobs. These workers find it convenient to remain downtown after work on their regular jobs to obtain some additional earnings as part-time department store workers.

Hourly Department Store Earnings Continue to Rise

The average hourly earnings of nonsupervisory department store workers rose 20.3 percent to $1.72 from 1958 to 1963 (table B, Appendix). This compared to an 18 percent increase to $1.80 during the period for workers in retail establishments, exclusive of eating and drinking places. Despite the somewhat higher rate of increase for department store workers, the hourly rate paid department store workers is still below the rate paid in retail trades as a whole, according to the Bureau of Labor Statistics.

On a weekly basis, the earnings of nonsupervisory department store workers in 1963 averaged $58.65 compared to an average of $68.04 for nonsupervisory workers in all retail trades. However, workers in all retail trades averaged 37.8 hours per week compared to an average of 34.1 hours per week for department store workers.

Contributing to the rise in department store earnings in 1961 was Federal legislation (Public Law 87-30) which provided for a minimum wage of $1.00 an hour, effective September 3, 1961, to workers in retail establishments engaged in interstate commerce and having a specified dollar volume of business. This legislation also provided for subsequent increases in hourly earnings to $1.15, effective September 3, 1964, and $1.25, effective September 3, 1965.

There was considerable variation in the earnings of nonsupervisory department store workers as of June 1, 1962, according to the Bureau of Labor Statistics June 1962 survey of department store workers. The June 1962 national hourly earnings for these workers averaged $1.62,

while among the four principal census regions, average hourly earnings ranged from $1.49 in the South to $1.83 in the West. For the United States as a whole, 59 percent of the nonsupervisory employees earned under $1.50 per hour. In the South 68 percent of the workers earned less than $1.50 per hour while in the West, the proportion was 41 percent.

*AGRICULTURAL LABORERS; WAGES; UNEMPLOYMENT; *MIGRATION; *ECONOMIC DISADVANTAGEMENT; SOCIAL PROBLEMS; LABOR FORCE; SEASONAL EMPLOYMENT; *EMPLOYMENT LEVEL; FOREIGN WORKERS; *EMPLOYMENT EXPERIENCE

Based upon data published by the Departments of Agriculture, Commerce, and Labor, this report concerning the 1.7 million farm workers hired in 1963, contained the following observations: (1) Farm numbers were decreasing, farm size was increasing, agricultural production assets per worker were $25,000, and productivity per worker was increasing, (2) Of all farms, 52 percent hired no labor, and 42 percent spent less than $2,500 for hired labor; only one percent of the farms hired 30 percent of the labor, (3) Farm operators and unpaid family workers outnumbered hired workers even at the peak of the season, but the total number of operators and unpaid family workers was decreasing, while the number of hired workers was remaining steady, (4) Farm population was decreasing and farm-to-city migration was high, however the lower level of education of rural farm people might have prevented the migration needed to relieve rural unemployment, underemployment, and low income, (5) Over two-fifths of those doing farm wage work did so less than 25 days during the year, and farm work is not the chief activity of one-half of the workers, and (6) There is more unemployment among farm workers than other workers even during the growing season. The report cites new federal laws enacted to alleviate problems. (JM)

Introduction

During 1963-

employment in agriculture averaged some 4.9 million. Of this number . . .

about 2.4 million were farm operators

.8 million did some work as unpaid family workers

1.7 million engaged in hired farmwork

These groups are not mutually exclusive. Some farm operators and unpaid family workers also engage in hired farmwork at times during the year.

This report is about those who work on farms for wages as hired workers. They are the part of the total farm work force upon which the larger farms--those responsible for most of our production--depend particularly. The workers' earning power, economic opportunity and security, and living conditions generally remain at low levels, although some gains have been made in recent years.

The study is based on data published by the Departments of Agriculture, Commerce, and Labor.

The Setting

Swift Technological Advance

--Higher production on fewer acres

Decline in Farm Labor Needs

Decline in Farm Population

Developments in mechanization and in the organization and techniques of farming are changing U.S. agriculture. The number of farms fell from 5,647,800 in 1950 to 3,573,000 in 1963. Despite a decline of 4 percent in total land in farms, the average farm size increased from 213 acres in 1950 to 325 acres in 1963.

The typical commercial farm became a sizable business involving a substantial capital investment. In 1963, the value of assets used in agricultural production exceeded $25,000 per farmworker, greater than the investment per production worker in manufacturing.

Productivity of labor resulting from improved technology and changes in the organization of agriculture increased 30 percent between 1950 and 1963, in spite of a decline of more than 40 percent in man-hours of labor for farmwork.

Technological developments have brought an explosive increase in the productivity of farmworkers, particularly since 1940.

. . . In 1910, each American farmworker produced food and fibre for seven persons.

. . . By 1963, each farmworker produced food and fibre for 31 persons.

The technological developments that have made this possible have substantially raised skill requirements for part of the farm labor force and have released many rural workers for industrial jobs.

The amount of farm labor needed has dropped sharply despite increased production.

Increased labor productivity has been the principal cause of the decline in farm employment, and labor cost represents a declining proportion of total cost.

. . . Between 1947 and 1963, farm wage rates increased by about three-fifths, but because of the decline in employment, total wage costs remained stable, and wage cost as a proportion of all production cost decreased. In 1963, farm operators spent only 10 cents out of every dollar of production cost on hired farm labor. In 1947, labor cost 17 cents of every dollar.

Most farms make little or no use of hired labor.

52 percent of all farms used no hired workers in 1959.

42 percent of all farms spent less than $2,500 for hired workers. For nearly three-fourths of these farms, the expenditure was less than $500.

6 percent of the farms had labor expenditures of $2,500 or more. Despite the overall decrease in number of farms, those reporting expenditures of $2,500 or more increased by 15 percent from 1954 to 1959.

A few very large farms accounted for a substantial proportion of all wage expenditures. Farms with sales of $100,000 or more made up less than 1 percent of the total number of farms but paid 30 percent of all labor expenditures.

Even at the peak of the season farm operators and unpaid family workers outnumber wage and salary workers.

The decline in number of hired workers has been less than that of operators and unpaid family workers. As the number of operators and family workers declines, hired workers take on more importance in the total farm labor picture.

As the number of farms decreased, fewer farm operators and unpaid members of their families remained in the agricultural work force.

On the other hand, demand for hired labor has been sustained by--

. . . Consolidation of farms into units larger than can be handled by the operator and his family.

. . . Increases in fruit and vegetable production which require large numbers of temporary hired hands.

. . . Replacement of young adults leaving the farm population by temporary seasonal hired workers.

As a result, average annual employment of hired workers decreased only 14 percent in the 1954-63 decade, while employment of operators and unpaid family workers decreased by 28 percent.

The farm population is declining, while the total population is growing.

In 1910, over 32 million persons lived on farms, and they accounted for 1 of every 3 people in the United States.

In 1963, fewer than 13.4 million persons lived on farms, and they accounted for only 1 out of every 14 people.

Migration from farm to city remains high.

The movement of farm people to urban areas has been one of the major trends in our Nation's history. Net migration from the farm totaled over 24 million from 1940 through 1963, averaging over 1 million per year during this period.

The largest decline in farm population since 1940 has been in the South and the West North Central States. All States have experienced some decline, however, except Alaska.

Average Annual Net Outmigration from the Farm Population, 1940-63

Lack of qualifications for skilled jobs prevents some people from leaving the farm.

While outmigration of farm people to cities has tended to relieve the problems of rural unemployment, underemployment, and low income, these problems are still severe in many rural areas. In order to move from rural areas, farm people need more education to qualify for skilled jobs in nonfarm occupations. But their level of schooling is lower than that of urban people and the lag is increasing.

Median Years of School Completed, 1950 and 1960

Numbers, Characteristics, Employment Patterns

Despite the great drop in total farm labor needs, the number of individuals in farm wage work increased in the 1954-63 decade.

The number of individuals who engage in farm wage work at some time or other during the year has fluctuated considerably over the past decade but is generally higher than it was 10 years ago.

The proportion of workers with enough work during the year to be considered regular hired workers--150 days or more--has been only about one-fifth of the total in recent years. The number who do farm wage work for only a short period of time--less than 25 days during the year--is more than two-fifths of the total.

Year	Total	Persons engaging in farm wage work (thousands)		
		Less than 25 days	25-149 days	150 or more days
1954	3,009	1,101	1,074	834

1/ Beginning with 1959, figures exclude persons doing custom work.

Most farmworkers are adult, male, white, and nonmigratory.

Many short-term workers in agriculture are women and youth. Sixty-one percent of the women and 67 percent of the 14-to-17-year-old farmworkers had less than 25 days of farm wage work during 1963.

For half of the farm wage workers, farmwork is not the chief activity during the year.

Chief Activity During the Year of Workers Doing 25 or More Days of Hired Farmwork, 1963

Of the 1,862,000 workers who were employed more than 25 days at farm wage jobs in 1963, a large proportion were out of the labor force or were unemployed much of the year.

The proportion of workers for whom farmwork was the major activity declined sharply from more than 70 percent in 1947 to 51 percent in 1963.

Hired farm laborers experience more unemployment than most workers.

For every 1,000 persons who had work experience of any kind in 1962:

838 had no unemployment;

104 had 1-14 weeks of unemployment;

33 had 15-26 weeks of unemployment; and

25 had more than 26 weeks of unemployment.

For every 1,000 workers whose longest job in 1962 was as a paid farm laborer:

736 had no unemployment;

138 had 1-14 weeks of unemployment;

59 had 15-26 weeks of unemployment; and

67 had more than 26 weeks of unemployment.

For most workers, the annual period of farm employment is short.

Seasonality is inherent in agricultural employment. However, it has been increased by the growing specialization of farms and by the use of machines, chemicals, and improved seed which reduce labor needs for many phases of crop production.

Even during the growing season, underemployment is more common among farm wage earners.

Percent of Employed Wage Earners Working Less Than 35 Hours per Week for Economic Reasons, 1962-63

Wage Rates and Earnings

Farm wage rates have increased.

Between 1947 and 1963, average hourly wages of hired farmworkers rose 60 percent, from 55 cents to 88 cents. During the same period, however, rural living costs rose 25 percent and the purchasing power represented by the average hourly wage increased only 29 percent.

The gap between farm and nonfarm wages becomes greater despite the rise in farm wages.

Percentage Increases in Average Hourly Earnings in Selected Industries, 1947-49 to 1963

Although many farmworkers receive supplementary benefits, such as free housing, there is no indication that they have shared in increased nonwage forms of income (such as paid vacations, premium pay for overtime, and employer-financed health insurance and pension plans) which have occurred in most other industries.

Farm wage rates show sharp regional variations.

Farm wage rates rise as one moves from the Southeast toward the North and West. The Pacific Coast States have the highest wage rates; the East South Central States, the lowest. In 1963, farmworkers along the Pacific Coast received more than twice the wage rates paid in some of the East South Central States.

In general, farm wage rates appear to be lowest in the Southeastern States, where the surplus of U.S. workers has been greatest, and in some of the areas in the Southwestern U.S. where foreign workers have been a major element in the work force.

The gap between farm and nonfarm wages becomes greater despite the rise in farm wages.

Percentage Increases in Average Hourly Earnings in Selected Industries, 1947-49 to 1963

Although many farmworkers receive supplementary benefits, such as free housing, there is no indication that they have shared in increased nonwage forms of income (such as paid vacations, premium pay for overtime, and employer-financed health insurance and pension plans) which have occurred in most other industries.

Farm wages are lowest in South; are highest on West Coast.

Low wage rates coupled with short periods of employment keep farmworker earnings very low.

In 1963, wage workers employed on farms for 25 days or more had average earnings of $1,087, including $204 from nonfarm jobs.

Those who worked:	Numbered:	And had average cash earnings of:
25 - 74 days	771,000	$ 514
75 - 149 days	392,000	813
150 - 249 days	309,000	1,411
250 or more days	390,000	2,240

Low annual earnings reflect --

. . . Average daily earnings of only $6.40 per day worked on farms.

. . . Substantial underemployment. Male workers 14 years of age or older, who comprise most of the workers permanently attached to the farm labor force, averaged wages of only $1,260 in 1963 from a combination of farm and nonfarm jobs.

Migratory U.S. Farm Workers

Numbers
Routes Traveled
Problems

Many farmworkers leave their home areas in order to extend their period of employment with additional seasonal farmwork; often a relatively full work schedule can be achieved through a series of short seasonal jobs.

There are about 400,000 migrant U.S. farmworkers. In 1963, employment of such workers reached a seasonal peak of approximately 240,000 at the end of July. Although reliable statistics are lacking, all the available evidence suggests a high turnover rate among migrants, i.e., a significant proportion of the migrants in any given year do not follow the crops the next year.

Migrant workers tend to follow well defined paths developed over a period of years. The largest of these migrations is the midcontinent stream. In Texas, nearly 100,000 U.S. migrants leave their home areas each summer for employment further north or west. In some cases, their departure creates a labor shortage which is filled by foreign workers. The East Coast pattern involves 30,000 to 40,000 workers moving up the coast from Florida and other southern States. Along the West Coast, there is a substantial shifting of workers for fruit and vegetable activities.

A large proportion of the migrants are members of minority groups. Negroes comprise about two-fifths of the total and Spanish-Americans about one-fourth.

Under the Department of Labor is an Annual Worker Plan scheduling migrants to farm jobs in advance of the season to provide greater continuity of employment for workers and a reliable labor supply for employers. In 1963, about 168,000 migrant workers in 10,300 groups received assistance under the Plan.

U.S. migratory farmworkers are employed throughout the Nation.

Migrant farmworkers face severe economic and social problems.

Substantial underemployment

. . . Migrants often suffer long spells of involuntary idleness between jobs. Even when they find employment, sudden damage to crops by adverse weather may leave the migrants without means of support, far from their homes. Twenty-eight out of every 100 migrant workers had less than 25 days of farm wage work during 1963. (Many of these short-term workers were, of course, women and children who were available for only a few days of work during the year.)

Low earnings

. . . Migrant farmworkers who worked at least 25 days at farm jobs during 1963 averaged only $657 from those jobs. The highest average was for white workers who earned $681 for 110 days worked on farm jobs during the year, supplemented by $231 earned from nonfarm employment.

Inadequate housing

. . . Although 30 of the States set standards for migrant labor housing, and the interstate recruitment regulations of the Department of Labor suggest standards where there are no State regulations, inadequate quarters remain a problem in many areas.

Insufficient education and child care facilities

. . . Women in migrant households must work to supplement low family incomes. Day-care of young children while parents are in the field is often inadequate. A transient way of life reduces educational opportunities. One-half of the migrant workers complete no more than 8 years of school.

Inadequate health and welfare facilities

. . . Because of low earnings, many migrants shift back and forth across the line between subsistence income and pauperism. Because of residence restrictions on State welfare assistance, migrants are usually ineligible for public aid. Health problems associated with poverty and lack of education are additional difficulties.

Recently enacted legislation will help to solve some of the migrants' problems. The Migrant Health Act of 1962 is designed to provide improved health care and sanitary conditions. Federal grants have been awarded for health projects in almost half of the States. The Economic Opportunity Act of 1964 provides for assistance to both government agencies and private nonprofit groups in establishing and operating housing, sanitation, education, and child day-care programs for migrants and their families. They will also benefit from the Farm Labor Contractor Registration Act of 1964.

Foreign Contract Workers

Numbers
Concentration

Started to meet wartime shortages, use of foreign contract workers continued at a high level for several years but since 1959 has declined sharply.

The first large decline in the number of foreign workers since the Korean War occurred in 1960. The decline has continued, and by 1963 the number of foreign workers admitted (209,000) was less than half the number of admissions in the peak years of 1956-59. The chief reasons for the diminishing use of foreign nationals were the mechanization of activities in which large numbers were previously employed, notably the cotton harvest; amendments to PL 78 enacted in 1961 which barred Mexican employment on machines or as year-round workers; and administrative measures taken by the Department of Labor, most notably a stricter interpretation of what constituted adverse effect on wages of domestic workers. PL 78, the act under which Mexicans were brought in, expired December 31, 1964.

Foreign contract workers comprise a relatively small proportion of the seasonal farm work force.

Foreign contract workers are used in all seasons and at peak make up almost one-tenth of the seasonal hired work force. However, foreign workers are employed on only about 1 percent of all U.S. farms.

Foreign workers were used to fill labor shortages in these States in 1963.

Use of foreign workers is concentrated in a few States.

Foreign workers contribute significantly to total production of some crops.

Employment of Foreign Workers, Selected Crops, 1963 Peak Periods

Summary and Conclusion

Advances in farm technology have drastically reduced employment on farms and brought about far-reaching changes in the organization of agriculture. There are no indications that the introduction of new and improved technology is slackening, and the plight of the great majority of farmworkers will continue to cause concern. Their wage rates are among the lowest, their rates of unemployment and underemployment among the highest. They are generally excluded from the protection of social legislation like minimum wage laws, unemployment insurance, workmen's compensation laws in most States, and Federal laws protecting the right to organize unions and to bargain collectively with employers. If they are migratory workers, they may also face social problems stemming from transiency--ineligibility for public health and welfare services, inadequate school opportunities for their children, discriminatory social customs, and lack of community acceptance.

The improvements that have been made in the lot of the farmworker should not be overlooked, however. Wage rates for agricultural work have risen considerably, although not as fast as in most other industries. The Manpower Development and Training Act and the Area Redevelopment Act provide opportunities for retraining, both for the skilled, better paying jobs in agriculture and for nonfarm occupations. Migrants will be helped by the recently enacted Migrant Health Act and the Farm Labor Contractor Registration Act which will be useful in correcting many of the abuses of the crew leader system. The Housing Act of 1949 was amended in 1964 to provide assistance in building low-rent housing for domestic farmworkers. The Economic Opportunity Act provides for special programs to combat poverty in rural areas. In addition to loans to low income rural families to help them effect a permanent increase in their income, it provides for housing, sanitation, education, and child care benefits to migrants and other seasonally employed agricultural workers. Aside from these special programs for rural areas, many farm residents will benefit under the Act from its more general provisions for community action programs, the Job Corps, and work training programs for youths.

Enactment of this legislation reflects great public concern about the welfare of farmworkers, particularly migrants. This public concern, probably greater than at any time since the depression of the 1930's, gives some reason for optimism that further improvements in the condition of farmworkers can be added to the modest gains recently made.

*LIBRARY SERVICES; *VOCATIONAL SCHOOLS; *LIBRARY STANDARDS; LIBRARY FACILITIES; LIBRARY COLLECTIONS; PERSONNEL NEEDS; STATE STANDARDS
CONNECTICUT

A full-time certified library-teacher should be provided for schools with 500 or more students. The library-teacher should be scheduled for not more than two teaching periods a day for schools with 300-500 students and scheduled not less than half time in the library for schools under 300. A minimum seating capacity of 40-45 pupils should be provided for smaller schools and 6 to 7 percent of enrollment for larger schools. A minimum collection of 5,000 volumes should be maintained for schools under 500 enrollment and a minimum of 10 to 8 books per pupil in that order for schools over 500. A minimum annual budget of $1,000 should be provided for schools of 300 students and under and $4 to $3 per pupil for schools 350 and up. A minimum of $80 a year should be provided for periodicals and supplies. Additional funds should be allotted every 2 years for replacements. (PS)

October 1964

VT004911

SUMMARY OF LIBRARY STANDARDS FOR CONNECTICUT VOCATIONAL-TECHNICAL SCHOOLS
REV. 1963 - 1964

PERSONNEL

Schools 500 and over

Full time Teacher-Librarian

Schools 300-500

Library-Teacher scheduled for not more than two teaching periods a day. Provision to be made for the supervision of the library at all times.

Schools under 300

Library-Teacher to be scheduled not less than half time in the library. Provision to be made for supervision of the library at all times.

Sub-professional clerical assistance to be provided for all schools in the period of organization.

Paid student assistants to be provided as needed for special tasks.

FACILITIES

Centralized library quarters are recommended for greater economy and efficiency.

Seating capacity of a minimum of 40-45 pupils for smaller schools. This provides for a class group plus five to ten stations for individual students.

Seating capacity of 6% to 7% of enrollment of larger schools.

Where possible a conference room and work room should be provided.

Additional storage room for periodicals should be provided nearby.

BOOK COLLECTION

A minimum collection of 5000 volumes should be maintained for all schools under 400.

Schools 500 and over should have a minimum collection of 10 to 8 books per pupil on this graduated scale.

APPROPRIATIONS

A minimum annual budget of $1,000 should be provided for schools of 300 students.

For schools 350 and up $4.00 to $3.00 per pupil should be annually allocated.

Where the original collection does not meet minimum standards, the annual appropriation should be increased to $8.00 to $10.00 per pupil until the desired standard is achieved.

Approximately every two years, additional funds should be allotted to provide for the replacement of the more expensive reference books, encyclopedia etc.

A budget for newspapers and magazines should be in addition to this book allotment. A minimum of $80.00 a year for supplies should be provided. This includes the cost

PROGRAM

Availability of library to teachers and pupils at all times is essential to the effectiveness of the library program.

The library should provide materials to supplement and enrich the curriculum, stimulate growth in factual knowledge and encourage development of literary appreciation and ethical standards.

It should offer instruction in the location, use and interpretation of library materials.

It should assist instructors in the enrichment of their areas of specialization by providing professional as well as subject content materials.

It should assist in the reading improvement program of the school.

CONNECTICUT STATE DEPARTMENT OF EDUCATION
Bureau of Vocational Education
Hartford

STANDARDS OF LIBRARY SERVICE IN THE CONNECTICUT STATE VOCATIONAL-TECHNICAL SCHOOLS

The Connecticut Vocational-Technical schools adhere to the following principles and practices as set forth by the American Library Association, School Library Bill of Rights.

"School libraries are concerned with generating understanding of American freedoms and with the preservation of these freedoms through the development of informed and responsible citizens. To this end the American Association of School Librarians endorses the Library Bill of Rights of the American Library Association and asserts that the responsibility of the school library is:

- To provide materials that will enrich and support the curriculum, taking into consideration the varied interests, abilities and maturity levels of the pupils served.

- To provide materials that will stimulate growth in factual knowledge, literary appreciation, aesthetic values and ethical standards.

- To provide a background of information which will enable pupils to make intelligent judgments in their daily life.

- To provide materials on opposing sides of controversial issues so that young citizens may develop, under guidance, the practice of critical reading and thinking.

- To provide materials representative of the many religious, ethnic and cultural groups and their contribution to our American heritage.

- To place principle above personal opinion and reason above prejudice in the selection of materials of the highest quality in order to assure a comprehensive collection appropriate for the uses of the library."

Personnel: Shall meet the Connecticut Certification requirements for the library-teacher.

Schools 500 or more	- full time certified library-teacher
Schools 300-500	- library-teacher scheduled for not more than two teaching periods a day. Provision to be made for the supervision of the library at all times.
Schools under 300	- Library-teacher to be scheduled not less than half time in the library. Provision to be made for the supervision of the library at all times.

Sub-professional or clerical assistance should be provided for all schools in the period of organization and whenever special needs arise.

Duties: The school library-teacher should:

- know the school curriculum and work with the administration and faculty to identify, locate and procure materials of all types and on varying levels of difficulty, for the improvement of the teaching program;

- work with teachers individually to locate and organize materials for specific units of work;

- work directly with students, training them in how to locate and interpret materials for their classroom and personal needs;

- offer regular planned instruction in the use of books, periodicals, bibliographical aids and other standard reference materials;

- keep administration and faculty abreast of new materials in the various fields, recommending and procuring these materials when necessary;

- organize, classify and catalog all materials for school use;

- be responsible for the circulation, repair and replacements of library materials;

- route new materials through the school so that the greatest number can benefit from the use of current materials;

- maintain a clipping file of current information of value to the school;

- prepare exhibits for library and classroom use;

- maintain a direct contact with the extra curricular activities offering assistance to the students in the growth of their interests in these fields.

- assist in the reading program of the school by cooperative planning with instructors by locating, procuring and organizing materials;

- report annually to administration concerning the library program, its accomplishments, costs and needs.

Facilities:

Centralized library quarters are recommended for greater economy and efficiency.

For smaller schools a minimum seating capacity of 40-45 pupils shall be provided. (One class group plus 5-10 seats for students working individually). The A.L.A. standards of 25 square feet per pupil should be used as the basis for estimating area needed.

For larger schools a seating capacity of 6% to 7% of enrollment should be provided. This is based on the type of schedule when 50% of students are in shop each week.

When possible, a conference room and separate workroom should be provided. Additional storage room for periodicals should be provided in an adjacent area.

Where space cannot be provided to seat the minimum 40-45 in the main reading room, the conference and work rooms may be eliminated and the workroom facilities designed behind cupboard doors at the end of the room or in the periodical storage area.

Equipment needs based on the size of the school enrollment and book collection should include:

Tables and chairs
Shelving - book and magazine
Catalog case
Atlas shelves
Legal size correspondence file - 4 drawers
Charging desk and chair
Dictionary stands
Bulletin boards
Librarian's desk and chair
Book truck
Typewriter and stand

In addition to shelving, the workroom should have running water, conveniently placed electrical outlets, and adequate supply storage space.

Book Collection:

The book collection should reflect every area of the school curriculum, trade, related and general education. Materials for the cultural growth of the students should also be included.

Materials should supplement texts, offering more breadth and variety and greater differentiation in the levels of reading difficulty.

Materials should include information and assistance in all the areas of learning which affect young people. The library has a responsibility to assist growing youth, by the various experiences received through reading, in the solution of their personal problems in home and family living, social adjustment and recreational interests as well as the specific curriculum of the school.

Materials for the professional growth of the staff should be included.

Financing the School Library Program:

A minimum of 5000 books should be maintained for all schools under 500 enrollment. For schools over 500 the minimum collection should be 10 to 8 books per pupil in that order.

Because of the large number of technical books which are substantially more expensive than the trade books and carry a shorter discount, the average cost per book is estimated at $6.50.

Wherever possible the initial allotment for books for the school library should provide a minimum budget to meet this 5000 volume collection. Present holdings transferred from the older school libraries should be evaluated in terms of condition and usability.

Where the initial allotment does not provide for the minimum collection, an increased annual appropriation should be provided until minimum standards are met.

An annual budget for satisfactory maintenance and growth should provide;

Schools 300 and under ---------- $1,000 annually.

Schools 350 and up ---------- $4.00 to $3.00 per pupil in that order of the scale.

Where the minimum collection has not been reached an annual appropriation from $8.00 to $10.00 per pupil should be provided until standards are met.

Approximately every two years, provision should be made for additional funds to replace or update essential references such as encyclopedias, handbooks etc.

In addition a budget must be provided for adequate periodical coverage. This will vary by schools according to trade offerings and curriculum variances. General library subscriptions as recommended should be provided for all schools.

A supplies budget of $80.00 annually should adequately meet the needs except on initial organization or unusually large accessions to the collection. This budget includes the cost of printed catalog cards.

Pub Date - Dec64 22p.

*ECONOMIC DEVELOPMENT; *COMMUNITY ORGANIZATIONS; *EMPLOYMENT PROGRAMS; *EMPLOYMENT SERVICES; MANPOWER UTILIZATION; EMPLOYMENT OPPORTUNITIES; COMMUNITY COOPERATION; *COMMUNITY DEVELOPMENT; COMMUNITY PLANNING; COMMUNITY PROGRAMS
UNITED STATES EMPLOYMENT SERVICE; USES

This publication is designed to help local employment service personnel and community leaders stimulate the formation of community employment groups which plan programs for increasing employment opportunities in local areas. A definition of community employment development and procedures for determining long- and short-range program goals are outlined. A checklist of local factors, and needed information relevant to them, for area planners to consider in formulating community development programs are identified. The factors are: population, manpower resources, occupational training resources, natural resources, location, market, local industry, industrial sites, local government, community facilities, educational institutions, health facilities, housing, transportation, utilities and power, weather, and communications media. Guidelines for establishing or appointing the appropriate organization to achieve community development goals are presented. The broad range of manpower services available to community developers through the public employment service officers, such as a variety of informational services and comprehensive employer and job applicant services, are specified. For a later report (1966) which discusses the contribution made to community development by public employment service offices see VT 006 161 (ARM Summer 1969). (ET)

community organization for employment development

FOREWORD

". . . the sources of poverty vary from family to family, city to city, region to region . . . we urgently need to bring together the many existing programs—Federal, State, local and private—and focus them more effectively in a frontal assault on the sources of poverty.

"Most important, we shall encourage and assist communities and regions to develop their own plans of action: to mobilize their own resources as well as those available under Federal programs."

President Lyndon B. Johnson—
Economic Message to Congress,
January 20, 1964.

The President's emphasis on community plans of action to attack the sources of poverty gives renewed importance to the overall community development approach and the community employment programs of the U.S. Employment Service.

The sources of economic expansion and local prosperity may vary. Local and regional community development groups reflect the unique needs of their communities and areas. They are, therefore, the best vehicles for encouraging employment opportunities within a community.

The U.S. Employment Service and its affiliated State employment services assume an important role in assisting community groups to plan programs which will effect new employment opportunities. Their concern with all factors which affect the Nation's manpower has helped the Federal-State employment security system to develop an alert responsiveness to changing needs. The broad range of ES services relating to manpower utilization and community employment development was designed to help obtain jobs and develop new employment opportunities for the present and future labor force. The Federal-State employment service system encourages the use of its broad manpower services to assist communities to rebuild, diversify, expand their local economies.

This publication is designed to help local employment service personnel and community leaders to stimulate the formation of community employment groups. It also should help those who are active in established community development groups.

This pamphlet was prepared by Ethel Polk under the direction of J. Dewey Coates, Chief of the Community Employment Development Branch of the Office of Manpower Analysis and Utilization of the U.S. Employment Service.

Louis Levine, Director,
U.S. Employment Service.

CHAPTER I

what is community employment development?

When community groups seek to increase employment opportunities in the local area . . . you have community employment development.

Promoting increased employment opportunities takes several directions:

Providing jobs for unemployed workers becomes a primary concern, particularly where there are many jobless workers.

Improving the use of manpower talents and skills is especially meaningful when employees work at less than their full potential—when they are underemployed.

Increasing employment opportunities is of community concern as youth swells the labor force in this era of population explosion.

A. Development Is Everybody's Business

A stranger in town, 20 years ago, coming upon a meeting which included representatives of churches, schools, industry, labor, women's groups, civic groups, and banking and commerce, might have assumed correctly that the meeting dealt with community fund raising or a similar activity. Today, he is likely to find that the meeting is called by an industrial development committee, with full community support, to offer encouragement for new business or industry to locate in town. He might find the meeting concerned with keeping an industry in the community or with diversifying the town's economic base.

Community development has been the subject of conversation, consultation, consideration, conferences, and more recently,

coordination, in communities throughout the Nation. Community self-improvement efforts have become part of the yardstick by which areas are measured when firms consider a new location. And broad participation by all segments of the community increases the respect for the community's efforts by company representatives in or out of the area.

Employment development in the community is affected positively by every improvement achieved, whether it takes the form of improved roads or better schools. Using schools for example: The broad view of employment development recognizes that better schools mean immediate employment in construction and maintenance and possibly more teachers, administrative personnel, and clerical staff. Better schools also mean that company representatives, seeking the best location, will be influenced by the fact that the company's employees may be assured of the best possible schools for their children. Better schools provide better education and training so that graduates are better qualified for employment. Moreover, improved schools may help encourage young people to remain in the community and this, too, is a factor influencing outsiders.

Employment opportunities in any community do not remain constant. The forward-looking community seeks to develop new opportunities for both the present and future labor force. Each participant in community development may begin with a specific interest. Expanded employment means more customers in the store for the merchant, more investment money for the banker, more paying clients for the doctor and lawyer, more profit for industry which, after all, depends on the consumer. Experience is proving that the broad approach of advancing the interests of the whole community is beneficial to each segment. Development of each community's human and natural resources to increase employment opportunity has become everybody's business.

B. The Initial Responsibility Is Local

Primary responsibility for dealing with local employment problems belongs to the local community. State and Federal Governments may cooperate with local governments and groups in promoting economic growth. They may help promote diversification of industry and stability. But community development is not permanently effective when it is superimposed from outside the locality.

The development effort must deal with local resources and examine local advantages and disadvantages. The solutions should be worked out and supported locally.

In all aspects of local community development relating to manpower—the human resources, the labor force—the Federal-State employment service system is the most accessible source of current information. It can provide information on manpower skills, experience, location, and availability.

The local office of the State employment service is qualified to interpret whatever relates to employment or unemployment, directly or indirectly.

C. Leadership Is a Community Resource

Every community has rich leadership resources. Some of its leaders may be specialists—for example, the architect whose expertness relates to planning in advance of construction. Others, such as the Mayor or city manager, are accustomed to representing the community as a whole.

Contributions to community development leadership may be made by any one or all of the following:

> Chambers of commerce, retail merchants, business associations, manufacturers, professional societies, bankers, better business bureaus, architects, engineers, accountants, attorneys, insurance groups, retired business leaders, school officials, unions, and civic and other interested groups.

Where no present organization exerts leadership for community economic-employment development, the initiative may come from persons in any of the groups listed above. Most communities, however, do have at least one group which is primarily concerned with economic development, and that group may serve as a rallying point.

Occasionally the impetus for local industrial development or economic development may originate with a statewide development or governmental group. This occurs especially where local competition in a geographic area has become wasteful and some degree of coordination on an area basis is recommended.

CHAPTER II

setting the goals

A sense of direction, a definite idea of goals desired, should be achieved before the organizational form is chosen for a development drive.

In almost every instance, two important steps should precede organizational action: SURVEY of the area's strength and weaknesses and ANALYSIS of the survey (with consideration of intangible factors) to determine realistic goals. Long-range and short-range goals should be determined but must be differentiated.

A primary goal for development groups, shared by the local employment service office, is employment stabilization—obtaining suitable jobs for workers and recruiting suitable workers for jobs. To attain this goal, a balanced supply of both jobs and workers must exist.

Job opportunities may be sought for both unemployed and underemployed workers. All factors of the community's life which affect employment opportunity and economic development should be considered in setting these goals.

A. Plan Priorities and Timing

Priorities should be considered. When the community's assets, liabilities, anticipated population growth, labor force, and skills are surveyed, it is possible to determine priorities among the projects to be undertaken and the liabilities to be reduced.

There should be no limit to the proposals considered, but the list should be realistic. Priority rank is given to problems including the following characteristics:

1. Projects considered essential to economic growth;
2. Situations important enough to merit communitywide action;
3. Projects which can be completed within reasonable time with tangible results.

The short-range priority projects are advantageous since their early accomplishment helps create community support.

B. Long-Range Planning Is Advisable

Comprehensive economic development planning is advisable for all communities. An "overall economic development plan" (OEDP) has been required before a community became eligible for assistance under the Area Redevelopment Act. Local employment service offices can be helpful to local

committees which need technical assistance in connection with such plans. Whether or not Federal or State aid is needed, long-range economic planning is advisable for all communities.

If no other circumstance demonstrates this need, the increasing labor force, with additional entrants added by each high school and college graduation, provides reason for long-range planning in every community.

C. What Kind of Industry or Commerce to Seek?

- New manufacturing industry
- Expanding industry already located in the community
- Merchandising
- Services, recreation, tourism, professions, consumer services, and facilities.

People tend to think of manufacturing as the major source of large-scale manpower utilization. Resourceful community developers, however, take a broad view in seeking employment opportunities. For example:

Park services provided by a community may not appear to mean many jobs, but a recreation area is soon surrounded by stores selling hunting, camping, fishing supplies, and by restaurants, motels, gas stations, and other service accommodations which usually follow.

Redeveloping blighted areas and updating community facilities bring short-range employment in demolition and construction. They also improve the economic potential of the local area involved—if only by making it more inviting for industrial or commercial expansion.

Merchants, service establishments, and professional persons are indirect but real beneficiaries of increased payrolls. In turn, they are employers, and the service trades are expected to be an expanding employment factor in the future. For example, 20 years ago considerably fewer people owned automobiles, TV sets, or air conditioners, and there was less need for auto salesmen, mechanics, car washers, TV repairmen, and other service needs which we take for granted today. In addition, suburban shopping centers and motels are quickly surrounded by beauty shops, barbers, even hobby centers, each involving sales personnel, service help for equipment, and office help.

New manufacturing need not depend on giant corporations. If a local natural resource can be processed locally by a small firm, an economic gain is achieved by the community. Ores and minerals with no current industrial value are being converted to costume jewelry. Instead of seeking distant markets for these, some communities have related tourist promotion with the availability of these resources for jewelry hobbyists.

Communities are learning not to wait until large contracts end or big industry decentralizes. Before critical circumstances occur, many areas are assessing their local industry to determine where expansion can occur via new products or markets.

D. Every Town Needs Its People

Communities are concerned that youngsters are leaving the "home town." Experience indicates that the youngster who intends to engage in a profession, such as teaching, medicine, or law, or in a highly skilled trade can be encouraged to practice in his hometown. Persuasion will depend on the way the community faces up to its economic problems. The community effort to help itself, to retain and use the whole potential labor force, will help in retaining its young people. Conversely, when employment mobility must be encouraged, the community's participation in a regional effort may help. If citizens can work on a commuter basis and remain residents of a community because the town made an effort, that community is making economic progress in keeping its young people as contributing citizens.

E. Evaluate the Community Resources

The following "Community Checklist" indicates many factors considered by plant location representatives of companies.* The thorough evaluation of a community's resources, including liabilities, has two values: It enables development groups to assess and publicize the advantages, and it may suggest potential industrial or economic expansion which might have been overlooked.

*The importance of manpower as a factor in plant location determinations by companies was confirmed in November 1963 by the Fortune Survey on Locating Plants, Warehouses, and Laboratories. Availability of workers led all other factors as a basic requirement considered by management in determining industrial location changes or expansion. Fifty-four percent of the respondents put manpower, availability of workers, first. In response to a question about environmental factors, 87.8 percent placed productivity of workers first. The availability of skilled labor was one of the five basic requirements considered. Thus, manpower information is of primary importance to managements concerned with plant location.

a community checklist

This checklist of local factors to be considered in community development may be helpful in analyzing assets and liabilities and in preparing brochures or other promotional material about the area's advantages.

1. POPULATION

What is the population of the State? the immediate community? the surrounding area? What are the forecasts for future population? What is the composition of the population and labor force by age, sex, languages spoken, education levels?

2. MANPOWER RESOURCES

How many people are employed, unemployed? What specific skills are available? Which skills are unavailable but needed? How many people are working in agriculture? in service occupations? in industry? in construction? in all occupations and skills?

3. OCCUPATIONAL TRAINING RESOURCES

What facilities and personnel are available for establishing multioccupational training programs such as those under MDTA and ARA?

4. NATURAL RESOURCES

What are the natural resources available in the area, e.g., metals, food, forest, minerals ? What items are imported? exported?

756-600 O—65——2

5. LOCATION

Where is the community located? What is its location in relation to major U.S. cities, to the State capital? How near is it to local or area markets? the Nation's principal markets?

6. MARKET

What is the specific trading area? How is it related to marketing facilities, including wholesalers, storage, and warehousing?

7. LOCAL INDUSTRY

How many industrial companies are in the community? What are their products? What is the type of production? Have there been recent additions? recent losses? Are special research and scientific facilities available? How much local industry (if any) is dependent on defense contracts?

8. INDUSTRIAL SITES

What land sites are available for industry? Are there restrictions? If so, specify. What financial aid, if any, is offered? Are industrial parks planned or already operating? Has anyone developed a master plan for the area? If so, specify.

9. LOCAL GOVERNMENT

What is the tax structure (personal and business)? What local laws are advantageous for industrial and business expansion? Which are disadvantageous? What zoning laws or other pertinent laws or regulations affect business or industry?

10. COMMUNITY FACILITIES

How many hotels or motels are there in town or nearby (indicate type or size)? banks? parking lots or garages? shopping centers? schools? post offices? recreational areas and facilities? cultural institutions? resturants? etc.? Are others needed? If so, specify.

11. EDUCATIONAL INSTITUTIONS

List every type of school with its enrollment and indicate whether it has grown. What transportation is provided? Is it adequate? Have school expansions been planned? What provisions exist for vocational training? adult education? business training? higher education? research facilities?

12. HEALTH FACILITIES

How many and what kinds of hospitals are available? doctors? nurses? health programs? clinics? technicians and institutions relating to health? How do they compare with the standards set by other cities?

13. HOUSING

How much and what type of residential housing is available in town? in the suburbs? How does housing location relate to community facilities? to industrial sites? What are general conditions in residential areas? Is there special housing for aged citizens? If so, describe.

14. TRANSPORTATION

What are the available forms of transportation in the area? for passengers? for freight? Are there airports nearby? Can they handle air freight?

15. UTILITIES AND POWER

What utilities and what sources of power are available? What industrial fuel? What are the rates? How do rates compare with those of other areas? What provisions are available for industrial waste, for sewage?

16. WEATHER

What are the maximum and minimum temperatures and how long do they last? Are there other climatic factors? (Climatological reports may be obtained from the U.S. Weather Bureau.)

17. PRESS, RADIO, TV

What communications media are available in the area? Do they have national affiliations? (Include TV; radio; press; special publications such as trade papers; farm, union, and foreign language press. List TV and radio programs of special characteristics and newspaper columns of potential use.)

18. GOALS CONSIDERED?

NEEDS EXPRESSED?

READY TO ORGANIZE?

The preceding checklist and general consideration of goals, priorities, timing, etc., should be applied from time to time and reapplied to keep the organization activities on the track and to change signals when necessary.

CHAPTER III

choosing the organization

"Is there need for a new organization?" is a question to be answered by the group initiating preliminary action.

One type of development group, active in most communities, is the Chamber of Commerce. The Chamber is, in most instances, likely to be represented among the participants discussing the need for organization for industrial development. Presently existing groups may be inappropriate because their original purposes cannot be adapted or their organizational form is restricted legally. Whether a new group is to be formed or an already existing organization is to serve as the vehicle depends on the goals and decisions made by the original participants. Existing organizations should be involved when and where appropriate even if a new group is formed. If one of the existing groups can fulfill the goal, a campaign, with broad community support, should be led by that group.

The following questions, in brief, should help determine the type of organization appropriate for the goals:

1. Is the community offering land sites or buildings which can be remodeled to suit industry or new factory sites or buildings as incentives for industrial location?

   If so, the industrial development corporation or foundation is the appropriate type of organization.
2. Is the community determined, primarily, to publicize its advantages for industries considering a new location or expansion through advertising, brochures, or other public relations methods?

   If so, the promotional type of organization, new or existing, is appropriate.
3. Is the goal a specific one which can be resolved in a single, short-term cam-

paign? For example, the town needs an airport—and the lack of air service has been hurting industrial expansion. The people may need to be persuaded to support building the airport facilities financially, legally, and through special zoning.

If so, the special-purpose type of organization, to promote solution of the one problem, would be appropriate.

4. Is competition among development organizations, or between two adjacent areas, hurting rather than helping? Would consolidation of groups or the simplest coordination help each area to achieve economic growth or expansion?

If so, a regional or area industrial development, or economic development, group should be organized, with each participant retaining its identity.

A. Overlapping of Functions Will Occur

The types of organizations mentioned above are described in terms of their primary function. Each, almost invariably, will experience overlapping of functions as part of the process of working toward the goal. The promotional group must deal with financing to raise at least enough money to achieve its purposes. The industrial financing group may undertake promotional activity to sell the campaign to the community or to call attention to the availability of financial incentives for locating in the area. The special-purpose group, usually of briefer duration, may involve both promotional and financial activities. Technical necessities, such as State registration of finance-investing or fund soliciting groups, make it necessary to distinguish the primary purpose of the organization before proceeding, in the event that legal distinctions do exist.

It should be noted that the following organizational information presumes that a new group is being organized. The details may be adapted, however, to serve as an organizational checklist in cases where an existing organization spearheads a development drive.

B. Highlights of Development Organization Characteristics

The negative and positive arguments presented below do not constitute recommendations. They are intended to help in determining the most appropriate organizational approach in each community or area, as part of the consideration of local leadership in making the decisions.

1. Promotional committee

A promotional committee for economic development is a public or quasipublic organization which engages in publicizing the community's advantages for the purpose of inviting new business or industry to locate there or encouraging home industry to expand. It also serves an important function in rallying community support behind actions designed to make the community more attractive or behind campaigns to finance promotion of the community.

Promotional methods used include:

- Personal contacts—
  via phone, over the luncheon table, in social contexts, etc.
- Brochures—
- Space in publications and newspapers—
  feature stories, advertising, photos, etc.
- TV and radio—
  news stories, interviews, advertising
- Special events—
  "Open House for Industry Day" or the like to stimulate public support and make news stories for press, radio, TV.

In general, the scope of the promotional committee is less limited than that of any other development committee. While some of its methods cost money, its operations are less costly than building a new plant or purchasing industrial sites. The disadvantages of a wholly promotional approach lie in the competitive nature of economic development.

2. Financial development group

An industrial development corporation, or foundation, or trust, whatever title is used, undertakes as its primary function the provision of financial assistance to expanding industry, business or firms seeking new locations.

Because the industrial development corporation deals in financing, its structure is formally corporate.

Financial development methods may include:

Making available industrial sites, for purchase or option to buy, prepare, improve or otherwise alter land for industrial sites.

Offering industrial facilities, building new plants, or rehabilitating existing facilities for lease or resale, usually on liberal terms, as an inducement to new industries or to assist "home industry" or local business to expand.

The leadership of the industrial financing group must choose whether the corporation will be nonprofit or profit-making. It also must decide whether to invite the community at large to invest or participate or to limit participation to the business community.

People who prefer to invest and receive a nominal return will advocate the profit-making type of corporation, and it may be argued that the management of a profit-making corporation will be more business-like in preserving the organization's assets.

The nonprofit form of organization is considered more attractive to persons concerned with tax advantages (deductibility) of a nonprofit corporation. Also, the nonprofit group may attract more communitywide support. Legal advice may be required to determine which is the appropriate form for the local corporation.

3. Special Purpose Committee

The special purpose, or limited purpose, committee is used when a community considers its economic problem temporary or at least susceptible to the one-shot solution or to periodic shots in the arm. In a community where the principal employer shuts down, a committee might be organized for the limited purpose of arranging for sale of the plant to another employer for continuity of employment for the displaced workers. Such a committee is promotional in character in most instances, but it might raise funds to buy the property for resale or to lease the space to new employment-providing industries.

Another form of limited purpose committee might petition the home office of a large concern to maintain or expand its local production facilities in the area. Usually this type of group forms when there is word that the parent company is planning to shut down the local branch or to expand elsewhere. Such a committee may seek to help local firms negotiate contracts with private buyers. Government procurement contracts or plans for placement of subcontracts have been the end in view of some limited purpose groups. Another single purpose committee function might be promoting amendment of tax and zoning ordinances to improve specific community facilities, such as utilities, housing, recreational or cultural facilities, streets, and highways. When local groups agree to coordinate their efforts for a period of time for a specific purpose, the committee representing the coordinated groups falls into the special purpose classification.

4. Area redevelopment committees

Since 1961, Area Redevelopment Committees have been formed throughout the Nation to plan job-generating projects for areas where substantial unemployment is characteristic. The Area Redevelopment Act requires that these committees be broad and representative of all major segments of the community. Where community leaders have agreed to designate an already existing economic development group to spearhead the drive, they have invited representatives of all major segments of the community to participate. One of the primary tasks of these committees is the preparation of an overall economic development plan which must be submitted to the Area Redevelopment Administration before an area may be considered eligible for ARA assistance.

As of late 1963, the more than 800 overall economic development plans submitted to the Area Redevelopment Administration were planned by committees ranging in name from the Area Economic Development Council to a Job Opportunities Committee. Many of these have stimulated organization of, or cooperation with, industrial development corporations. Others have initiated economic development promotion in their areas.

Regardless of whether Federal assistance is needed or a community is eligible for ARA, Federal emphasis is on community self-help and local economic planning.

B. Community Development Organizational Structure

Several common organizational considerations are included in the following broad checklist. In all cases, they should be adapted to local needs.

1. Leadership

a. A chairman should be chosen whose role will be coordinative. His background should include past leadership status, and he should have the respect of most segments of the community.

b. An executive or steering committee should be selected to make decisions and to interpret policy in the light of overall goals. This group should establish priorities for action. If circumstances require a large executive board or committee, a smaller steering committee may be needed to assure continuously active leadership and authority.

2. Subcommittees

Subcommittees should be formed to cover major functions. Since employment is a primary measure of economic development progress, a manpower or human resources subcommittee is desirable. Subcommittees should include:

a. Finance.—To obtain and administer funds to achieve the purpose of community development and to sustain the organization.

b. Publicity.—To persuade the community to cooperate fully and to sell the world outside on the advantages of the area.

c. Membership.—To promote broad or limited membership participation must be decided at an early stage. Widespread membership helps to demonstrate full support; smaller memberships are potentially more efficient.

d. Legal.—To provide information on zoning ordinances and State or local tax laws; to insure that structure of the organization meets legal requirements, and to avert embarrassment through inadvertently careless advertising or commitments.

e. Manpower or Human Resources.—To evaluate all aspects of the manpower resources in the area labor force (skilled, unskilled, professional, etc.) and to promote full use of all potential aids. This committee should include persons informed of employment opportunities, e.g., the manager or representative of the local State employment service office and also union and industrial personnel officials.

f. Home Industry.—To promote expansion and growth of "home industry." This committee should include representatives of industry with roots in the community. Its projects might include intercession on behalf of local business with State, local, or Federal Government agencies, military defense contractors, or the home office of firms where support of expansion is advocated. The members of this committee might draw on the talents of retired businessmen as consultants to local industries in solving management problems relating to sales direction, production, and transportation or in helping industries recognize suitable new product lines. This committee could survey local businessmen to determine if there are barriers to expansion which could be reduced and if there are problems involving community relationships to be solved to help home industry, e.g., city zoning, planning, and financing.

g. Reception-Sales Committee.—Whether part of the executive or steering committee or a separate group, a responsible cross-section of leadership should function as hosts in showing the community to prospective new business representatives. This group should include persons thoroughly familiar with all facets of the community. (If the State Employment Service is not directly represented, the visiting businessmen's itinerary in the community should include a stop at the local employment office to discuss the area manpower picture.)

h. Contract Negotiations.—The legal committee and contract negotiations committee are important, especially, to the financial type of industrial development group.

i. Staff.—An industrial development corporation may find it advisable to consider a professional industrial development person who would be responsible for the operations of the corporation. Where area industrial development corporations are operated by resident members contributing their time and effort, it is necessary that the divisions of authority and responsibility be clearly fixed, whether or not a director is hired, and decisions relating to finances, investments, loans, etc., are subject to determination by a responsible policy committee.

Even in the smallest organization, a person should be designated as secretary or administrative assistant to conduct the everyday business, respond to phone calls, and handle correspondence.

Volunteers, such as the consultants enlisted by the Home Industries Committee, are encouraged to work closely with staff personnel and the steering committee or officers.

Flexibility is a vital ingredient in applying organizational structure to a community development group's goals. The committees described here and in the following charts suggest functions which are sustained, in many smaller cities and towns, by a small group of individuals. The area circumstances and personnel currently available will be considerations in determining the structure and number of committees and combinations of functions.

COMMUNITY EMPLOYMENT DEVELOPMENT ORGANIZATION CHARTS: The following two charts are organizational composites, adaptable to local needs. In both charts, committees with which local State employment service office representatives can be particularly helpful are noted by an asterisk (*). This does not preclude local employment office activity with other committees as well.

COMMUNITY EMPLOYMENT DEVELOPMENT PROMOTIONAL ORGANIZATION AND FUNCTIONS

*A local employment service office representative could be most helpful on this committee.

Examples of special subcommittees functioning, as needed, under the above committees:

Brochure Publication - committee collects information from the resources committees and works with Advertising and Action Projects committees and publicity chairman to design and arrange effective brochures inviting industry or tourists...

Highway and Roads - committee works with community resources, action projects, and legal advisors to promote improvement of highways or roads to expedite industrial expansion.

"COMMUNITY JOBS, INCORPORATED"

or

(LOCAL) INDUSTRIAL DEVELOPMENT CORPORATION

*A local employment service office representative could be most helpful on this committee.

CHAPTER IV

the local employment office in community development

The local public employment office is the first agency to become aware of developing manpower problems. It is probably more familiar with the existing local economic situation than any other organization. It should, and often does, play a vital part in local employment development activities.

The interest of the local employment service office in area economic development derives from its statutory mandate to seek the reemployment of unemployed workers, to seek high levels of employment, to match men and jobs, and to achieve optimum utilization of a community's human resources. Helping the community's economic growth is an important way of finding jobs for workers. The chambers of commerce, industrial development corporations and committees, government agencies, unions, and other groups directly involved in planning expansions which create jobs for new employees (or new placement for underemployed workers) need area labor and manpower information which is readily available through the local employment service office.

Let's trace a typical example:

A local industrial development group has been organized. One of its committees is assessing the area's assets for prospective industrial location. How do you find out what kind of a labor force the community can offer? What skills are available? Which workers can be trained to adjust their experience to new skills needed? What are the pay rates in the area? These are some of the questions industry and business will ask about the labor force as it considers location in a community. The industrial development group turns to the local State employment service office. Most of the information is readily available because the local office maintains up-to-date resources.

To answer additional questions, the local office may offer skilled personnel to help design an appropriate survey. Training needs are made clear—for example, a possible new industry to locate in town will need machine operators and other skilled and semiskilled workers. The company will also need persons trained to repair and maintain plant equipment, and office help may be needed. The area skills survey conducted by, or with, the local State employment service office will indicate available skilled workers and also help in the selection of persons who can be trained to meet the employers' manpower requirements. On the basis of training needs of communities and individuals, the local State employment service office then cooperates with educational authorities to set up training.

The foregoing action is an example of what happens when there is some knowledge of the kind of industry which is considering locating in the area. Another common circumstance occurs when the industrial development organization has no specific industry in mind and no knowledge of any specific group interested in the location. In this situation, the information made available by the local State employment service office, information on available skills and the composition of the labor force, will constitute a vital part of the persuasive material to be included in brochures and discussions with new industries considering the area.

The availability of labor force information and the service of the local ES office as the community manpower center will help stimulate efforts in community employment development. Knowing that the ES office can provide reliable information and help in negotiations with industry or business firms, the industrial development leadership will move with greater confidence towards effective employment development activity.

1. Available Local Employment Office Resources Pertinent to Employment Development

   a. Informational Services:
      - Developing, analyzing, disseminating area labor information, including future outlook;
      - Surveying skills needed in area—skills available among workers; identifying training needs;
      - Surveying types of industry needed to diversify economic base and to promote employment stability; kinds of

industrial economic development needed to absorb the unemployed.

- Information on, or guidance as to where specific information can be obtained about labor laws, labor standards, workmen's compensation, unemployment insurance, wages, hours, working conditions, welfare and pension plans, automation, technological change, laws affecting management-labor relations.

b. Employer and Applicant Services:

- Recruitment, determining qualifications, referral of workers, vocational counseling, aptitude testing, training and retraining, special services to youth, older workers, minority groups, farm labor, veterans, and handicapped workers.
- Identifying training needs and cooperating with educational authorities in setting up programs;
- Initiating and/or participating in economic-employment development organizational activities within scope of manpower services center;
- Advising and helping communities obtain aid for economic development under Federal programs.

2. Additional Informational Resources

Many State and Federal agencies maintain regional or area offices and are listed in the phone book. The local employment service office will suggest the nearest contact when State or Federal assistance, service, or advice is needed. Public libraries and U.S. post offices are also helpful resources.

☆U.S. GOVERNMENT PRINTING OFFICE: 1965 O—756-600

POSTSCRIPT . . .

notes in conclusion

The U.S. Employment Service and affiliated State employment services are glad to assist all public and private groups in the programs and processes that make up Community Employment Development.

This pamphlet is designed to help community groups make the best use of the broad range of manpower services available through public employment service offices in their economic development planning. Unemployment insurance serves to maintain purchasing power in communities where layoffs jolt the economy and, at the same time, helps employers by keeping the skilled labor force at hand. The local employment service office knows the area's work force and can report on its full potential and most effective use. It can plan to supply the needs of employers for workers as communities plan economic development. It can provide all kinds of accurate area labor information which is needed in the development of a well-rounded community development program. It can select workers for training and help sustain a measure of income for these trainees, thus helping sustain community income. It can help plan for the future economic health of communities.

In short, it places all of its facilities, in one package, at the disposal of communities in support of a full communitywide effort. The local State employment service office is anxious to be a part of community development efforts. Its reward will be the immense satisfaction of making a contribution where it counts most—in the city, town, or hamlet—in the community where, in the final analysis, the solution to our more basic economic and manpower problems must be found.

The Employment Service Goes to an Armour Plant Closing.

Iowa State Employment Service, Sioux City
MF AVAILABLE IN VT-ERIC SET.
Pub Date - Jun63 15p.

*EMPLOYMENT PROBLEMS; *JOB LAYOFF; *INDUSTRIAL PERSONNEL; *MEAT PACKING INDUSTRY; EMPLOYMENT PROGRAMS; *EMPLOYMENT SERVICES; UNEMPLOYED; COMMUNITY STUDY; COMMUNITY PROBLEMS; VOCATIONAL RETRAINING
SIOUX CITY; IOWA

Over 1,300 employees were without work as a result of the closing of a meat packing plant in Sioux City, Iowa, in 1963. Some observations by community and government agencies who handled the problems involved were: (1) Advanced planning, extensive interviewing, testing and counseling, retraining programs and community support are required, (2) The program should be activated rapidly, (3) Top interviewing techniques by efficient and well accepted employment service personnel are necessary, (4) All community groups must participate to aid the unemployed and improve the economic life of the area, (5) The level of general unemployment in the area has a direct bearing on whether displaced workers can be readily absorbed, (6) Good relations are needed with the press, TV, and radio stations, and (7) The retraining of workers is necessary when new skills must be learned in order to find another place in the labor force. Major problems were: (1) The wage rates on new jobs were often not equal to former wages, (2) The unemployed were reluctant to move from Sioux City, (3) The unemployed were reluctant to enroll in training programs unless guaranteed a job after training, and (4) The secondary effects of reduced payroll in Sioux City reduced employment in other industry and business. THE EMPLOYMENT SERVICE GOES TO AN ARMOUR PLANT CLOSING

A REPORT BY
IOWA EMPLOYMENT SECURITY COMMISSION
IOWA STATE EMPLOYMENT SERVICE

THIS CASE HISTORY OF THE CLOSING OF THE SIOUX CITY, IOWA, ARMOUR & COMPANY MEATPACKING PLANT IN JUNE, 1963, HAS BEEN COMPILED AS IT DEVELOPED OVER A PERIOD OF A YEAR. SPECIAL TECHNIQUES AND MATERIALS WERE USED IN SOLVING THE MANY PROBLEMS ASSOCIATED WITH THE CRISIS AND THESE WILL BE OF INTEREST TO OTHER STATES INVOLVED IN LAYOFF SITUATIONS AS THEY PREPARE SIMILAR WORKER SERVICES.

THE EMPLOYMENT SERVICE GOES TO AN ARMOUR PLANT CLOSING

Sioux City, Iowa, June, 1963

INTRODUCTION

An impending crisis in local unemployment in March, 1963, at Sioux City brought the local Iowa State Employment Service office, the Iowa Employment Security Commission, regional and federal officials into action. Soon there would be a change in the Sioux City industrial skyline with the closing of the large Armour & Company meatpacking plant in June and its subsequent razing. Sioux City had lost its largest, most solidly entrenched employer.

It was a shock to the packing house workers and fellow residents of Sioux City when the advance rumors were officially confirmed on March 14, 1963. The last day of employment for 1,178 production and maintenance employees and approximately 200 administrative employees would be June 16, 1963. The 60-year-old Armour meatpacking plant was closing its doors in a final shutdown.

While Sioux City had a nonagricultural payroll of 34,000 employees, community leaders expressed fears that it would be difficult to find work for the ex-Armour workers. The community had come to regard the meatpacking workers as a blue collar class whose strong union support had won for them more and better fringe benefits and higher wages than were paid other employees in local industries.

The March, 1963 civilian workforce in Sioux City was 43,870. The loss of the Armour plant with its annual payroll of $7 million meant that one in every seven factory workers in the community would be out of a job.

HISTORY

In 1860, six years after Sioux City was founded, the first meatpacking plant to rise in the rugged frontier town was started with local money by James E. Booge. As the frontier pushed across the wide Missouri River, his meatpacking business prospered and Sioux City developed into a major livestock shipping point for the Midwest. By 1880, Mr. Booge had built a huge half-million-dollar plant.

Other meatpacking plants were built by other entrepreneurs and they, too, prospered and became the backbone of Sioux City industrial life.

Now, more than 100 years after the first plant was built, the local meatpacking industry is being returned to hometown domination as the big-name packers close their rambling, multi-story plants and leave Sioux City.

GROWTH

From 1880 to 1890 the population of Sioux City expanded from 7,366 to 37,806. The 1910-1920 period was noted locally as a boom time with a population jump from 47,828 to 71,227. This was the era when Iowans referred to Sioux City as their "Little Chicago." The citizens lived up to its rugged name in word and deed. But times do change, and the prosperous days were forgotten in the depths of the Great Depression years of the late 20's. This depression affected not only Iowa farmers, but plunged the stock brokers in Manhattan into despair.

The 1930's are remembered in the Midwest chiefly as years of long summer droughts. The 40's were the World War II years with prosperity returning in the 50's.

The 1960 census for Sioux City raised the growth of the northwest Iowa city to 90,000. However, this increase was offset by the decline in the number of persons in the 20 to 40 age group as the younger working people left the state for greener working pastures.

One of the economic factors credited with the upset of the local economy was the phasing-out by the federal government of its air base installations at the Sioux City airport.

The Armour plant was not the first large meatpacking plant to feel the changes brought about by the technological revolution that has touched and automated most operations within the meatpacking industry. A Cudahy plant in Sioux City was shut down permanently in 1954. These older plants could not compete in output without major rehabilitation at costs considered prohibitive by their respective managements.

Modern, one-story meatpacking plants using the latest techniques were designed and built for stepped-up processing of more livestock faster and at a competitive price. More than five million head of livestock go through the Sioux City stockyards each year, making it the third largest market place in the United States. It is ranked just behind Omaha, Nebraska, and St. Paul, Minnesota, on the list of major livestock yards.

Present Sioux City meatpacking plants include the Swift plant, along with the newer meat processing plants which can handle as much livestock as the previous giants of the industry ever could. But these new automated plants need to employ fewer people, and the call for fewer workers causes economic repercussions in the area. An example is the new beef-kill plant that requires only 80 workers. The old Armour plant had employed a daily roster of 900 people plus additional gate hires needed at peak production times.

While there is no specific slum area in Sioux City, there are many low-class dwellings. An estimated three-fourths of the non-white population live in sub-standard homes. The city has a small urban renewal project in conjunction with the Floyd River channel relocation project.

In 1961 Sioux City was selected as the All-American City, an award for civic progress, sponsored annually by the National Municipal League and Look Magazine. Its reputation for being aware of civic problems and for efforts to do something about them met an acid test in 1963.

STEP-BY-STEP ACTION REPORT

The Sioux City Employment Service office staff began working with the Armour plant officials on March 14, 1963, the date the closing was announced. The local ISES office prepared Form ES-235, Establishment Report of Mass Layoff, on March 15, 1963, and forwarded it to the administrative office in Des Moines. The occupation and sex of permanent workers involved in layoff were as follows:

OCCUPATIONAL CODE (6 digits)	PLANT JOB TITLE	NUMBER OF WORKERS Total	Men	Women
1-05.01	General Office Clerk	30	18	12
4-09.20, 4-09.40	Skilled Butcher	100	65	35
6-09.1, 6-09.2, 6-09.3	Semi-Skilled Butchers	225	175	50
6-09.2, 6-09.3	Semi-Skilled, do not use knife	200	180	20
8-09.11	Laborers	250	200	50
	All Others	55	49	6

(Armour personnel stated that it would be impossible to break down the various positions in the meatpacking plant since jobs are considered in the broad classifications listed above. A minimum of 400 different jobs was given. Promotion was based on seniority, with openings being posted for bids and not on the basis of attained skills.)

Form ES-235 showed that the local Employment Service office was invited to participate in the resolution of manpower problems due to the layoff. The local office manager believed the impact of the layoff would have a secondary effect on business in many divergent categories and would push the Sioux City unemployment rate to about 6.3 percent.

The local manager went to Omaha, Nebraska, to study methods used when the Cudahy Packing Co. automated its plant in 1959 displacing 925 workers. He said he wanted to "glean from the Omaha experience What To Do and What Not To Do."

The Iowa State Employment Service on the local and state levels explored ways of helping the Armour employees when and if the plant should close. Meetings were held with national, state, regional and local representatives of the company, the union and the Employment Service to chart a course of action. The decision on the actual steps to be taken was reserved to the local officials.

Arrangements were made with the company's officials for a labor market economist from the administrative office of the Iowa Employment Security Commission, Des Moines, to meet with Armour plant personnel. The labor market economist was granted access to some company records after assuring officials that information secured from Armour would be treated confidentially and the ES would not attempt to influence any decisions that had been made.

A quick check revealed employee record cards contained information concerning jobs held but nothing on current job assignment, vacation data, grievance data, and disciplinary action. Records were practically devoid of the type of statistical data required for ES purposes. A subsequent request for access to the payroll record was not granted.

An attempt to use a personal data form to be filled out by each employee was acceptable but was approached with extreme caution because of the union-management relationship. The company required union approval which was secured through the diligent efforts of the local ES office manager the evening of March 19.

Company approval to use a personal data form was secured on the following day, but the firm would not distribute the form to workers until management had a chance to discuss it a week later at a regular meeting. At this point, the speed necessary in handling such situations had been lost.

Several steps which would be taken, some by this agency and some by the community, were enumerated:

THE IOWA EMPLOYMENT SECURITY COMMISSION WOULD:

1. Interview and classify, by skill level and skill potential, all workers affected by closing of the plant.
2. Explore every industry and business in the area to uncover any jobs which are going unfilled and for which these workers may be qualified or can be prepared.
3. Provide the community with the criteria established for participation in existing federal programs under present federal regulations.
4. Prepare and carry out, in conjunction with the State Department of Public Instruction, training projects to develop the potential skills of the affected workers according to the needs of the community.

Community leaders should take action to:

1. Attempt, through proper channels, to have the criteria waived which have been established for preference on government contracts.
2. Take action to have the criteria changed for participation in other Acts of Congress such as the Public Works Acceleration Act.
3. Assist the Employment Security Commission employees in obtaining a listing of all job openings in the area.
4. Assist in obtaining the cooperation of Armour & Company in making the workers available for interviews before the actual closing date.

The proposed action by the agency would require financial resources which were not presently in the budget. Interviewing, testing, and counseling of the workers by the Employment Security Commission would require additional resources. A supplemental budget request was prepared and submitted to the Bureau of Employment Security.

The local ISES manager kept the state office informed at all times and in detail through weekly and monthly reports, plus special reports, as requested, on the status of the Armour displaced workers. Regional and federal officials were also interested in following the progress of the Sioux City problem in great detail.

A committee of 29 business and labor leaders had been formed in March, 1963, by the city council to explore ways of keeping Armour in Sioux City. Proposals for helping Armour included financial assistance for plant modernization and wage reductions by labor to reduce costs. The committee's efforts proved of no avail.

In April, plans were made in the administrative office of the Iowa State Employment Service in Des Moines to send the mobile team of interviewers from the special Community Development Program to Sioux City. The team went to Sioux City in May for month-long series of interviews with some 850 Armour workers. Meanwhile, special forms were developed to aid in obtaining specific information on each individual to classify his own skill level and occupational potential. Each in-depth interview required 45 minutes to one hour to complete. Both union and management cooperated in arranging for the workers to take time from their jobs for the interviews and in setting up plans for mass claims taking.

The active file of persons seeking work in Sioux City through the local ISES office was 1,434 on May 1, 1963. Add the Armour 1,100, and the local office load would be increased by almost 100 percent.

Husbands and wives were invited to attend evening group meetings to learn what was being done to help their breadwinners. Reports of unemployment in other cities where Armour had closed large plants had added to the gloom and doom rumors. Attendance was good at the Sioux City meetings and helped to clear the air as well as pinpoint objectives of the Employment Service.

The local office had access to occupational surveys from the regional BES office, job inventories for Iowa, Nebraska and Minnesota and lists of prospective and planned MDTA programs.

In May, 1963, the Citizens Re-employment Committee was formed; and, as a part of its work, sent 420 letters to other meatpacking plants in the nation telling them experienced meatpacking employees were available.

On June 17, the Sioux City Chamber of Commerce mailed approximately 1,500 letters to its members to develop job openings. A list of the occupations of the available applicants, a survey form and a return envelope were enclosed. Early responses were good and 40 replies containing 89 job openings were referred to the local Employment Service office for action. However, at this early stage, Armour employees were exceedingly reluctant to accept employment that paid less than their previous wages.

Every effort was made to give priority to these workers in finding new jobs. In addition, counseling and GATB testing were continued in the local office as a part of the regular office operations.

The Sioux City Employment Service office explored the many industries and service outlets in the area and uncovered jobs that could be filled by employees soon to be released by Armour. The drying up of the source of $100 million annual income was sufficient impetus to many community-minded citizens to respond with offers of jobs.

A special mobile team of interviewers from the state office conducted in-depth interviews, testing and counseling of workers at the Armour plant. As one of the mobile team of interviewers declared, "We're not so much interested in what a worker has been doing as we are in what he used to do years ago or what he now has the ability to do." A man who cut off pigs' tails for 20 years is an expert at that task, but what is he to do for a living when he no longer has that special job? And, that worker wanted to stay in the meatpacking industry.

Many saleable skills in the labor market would have remained unknown to the local ES office, and probably to the worker as well, if only the usual application taking had been used instead of the probing in-depth interviewing technique.

For example, an ice crusher, man, age 59, and an Armour's employee for 21 years, was placed as a frame maker with a woodworking shop.

Another Armour's employee, a woman trimmer, age 50, with 13 years seniority, was placed as a sales clerk in a large department store.

This in-depth information proved to be an invaluable guide for planning and for reporting the nature of the re-employment problem to the community through the local newspapers and radio stations.

A summary tabulation was run on data processing equipment showing the universal characteristics of the workers involved in the Armour plant layoff. These data were summarized by age group with breakouts by sex, education, seniority, number of dependents, hourly wage, and number with future work plans, disabilities, and with special training. In summary form, 903 (167 women) workers were interviewed. Their average education was 8 years, their average seniority was 14 years, their average number of dependents was 2, their average hourly wage was $2.31; and the number with future work plans was 115. Those workers with disabilities numbered 90, while only 76 had special training. More than 50 percent of the former workers were 46 years of age and over. Nearly half were classified as unskilled workers.

Since the Sioux City workers had a somewhat higher education level, the outlook for them was more favorable than for the ex-workers in other Armour plant closings. However, their average age was higher than in the other plant closings and posed a serious problem in finding new employment for the displaced workers.

Data on the general information listing for Armour workers also included: codes (up to 3), years of employment at Armour, straight time hourly pay (ending wage), does he want work, has he been tested, is he willing to move (7 sub-items, each with 2 or more further breaks), is worker old enough to retire, type of present housing with 4 sub-items, and is worker main family support.

The sub-items on "willing to move" explored whether the worker would be willing to change jobs, what pay rates he would consider, if he would work for another firm, would he give up his seniority, would he pay his own moving expenses, and how far would he be willing to move.

The sub-items on "willing to train" covered wage rate requirements, moving, training costs and training time.

The sub-items on "housing" covered ownership, buying and renting. This general information listing could be the basis for an extended study and analysis; but, in the interest of time, it served as a placement tool for use in the local office, and in the state office as a guide to the types of training and related programs that could be instituted to help these individuals.

A second listing was prepared showing general information of each individual Armour worker. This listing was arranged in social security number sequence. In addition, a "locator listing" was prepared in social security number sequence and this listing gave the Armour workers' name and address. Thus it was possible to find the name and address of any of the Armour workers for which general information was available if it became necessary. However, it was also possible to keep the individual identification confidential by not releasing the "locator listing."

On February 15, 1964, a two-hour session in group job finding was held by the local ES office. Topics included labor force knowledge, how to fill out work applications, how to make up a work resume, use of the letter of application, how to interview for a job. Response was good and future job finding sessions were planned.

Interviews with 298 of the remaining unemployed Armour workers began in March, 1964. The same type of information report form used by the mobile team was utilized for these interviews. Changes were expected in the workers' attitude about mobility, training and minimum wages as they realized that they would have to re-train or accept jobs with lower wages than at Armour.

A series of four profile sheets listing 25 available Armour workers each week for four weeks was started in April, 1964, and was mailed to 70 local Sioux City employers. At first count, eight placements could be credited, in part, to the spring job drive promotion. The profiles covered outstanding applicants, including laborers, janitors, porters and body maintenance men.

A job development sheet listing ex-Armour employees willing to relocate was mailed to all meatpacking establishments in Iowa, Nebraska, South Dakota and Minnesota.

By the end of May, 1964, unemployment insurance claimants had for the most part exhausted their claim benefits. However, 40 displaced persons were still active and had extended their claim benefits by reporting payments from social security and private pensions.

SECONDARY EFFECTS

A survey was made in late March, 1963, to determine estimated changes that would come about in the community pursuant to the Armour closing in June.

Sioux City Construction League: Much repercussion would be felt in the construction industry as it was stated residential construction had already been over-extended. Commercial construction in the area currently in progress included two junior high schools.

It was estimated that fewer carpenters, masons, plumbers, metal workers, furnace installers, excavators and laborers would be needed in the 1963 season.

The Armour closing was expected to have an adverse effect on the jobs open to the high school and college youth seeking summer employment in construction. Around 10 percent increase in unemployment was due to the influx of students.

Industrial Development Council: Armour Plant No. 2 which produces Gus Glazer meat products and is separate from the main Armour plant will continue in production. It is anticipated the present work force of 40 would be increased to about 80. (It was finally estimated that only an additional 10 employees went on the payroll.)

Other estimates predicted that repercussions from the Armour closing would be evident in the Sioux City area for about two to three years. New industries might be coming into Sioux City, but there was no indication of the type or number of workers that might be involved.

A pessimistic statement heard from many quarters was that no business in the Sioux City area would hire Armour personnel with the underlying implication aimed at strong union affiliations.

Local Teamsters Union estimated 20 jobs of their members would be affected by the Armour plant closing.

Greater Sioux Land Merchandising Council predicted a slight but cumulative effect on major establishments. Some small stores will be affected and go out of business, but it is almost impossible to lay this directly to the Armour closing rather than on large establishments who compete with the smaller ones because of volume sales and purchases.

Railroads: Fewer meat products were being shipped by rail. Employment reductions in this industry will result from recent court decisions and will not be much affected by the Armour action.

Truck Lines: Only truck lines hauling principally for Armour were contacted. Little change was anticipated, although it was too early at the time of the report to be certain. No estimate could be obtained.

The president of the Sioux City Stock Yards Company was optimistic about the future of the nation's third-largest livestock and meatpacking center.

He explained that Sioux City's centralized location in the heart of the greatest feeding territory in the nation and its accessibility by rail and truck should keep the stockyards among the nation's leaders. In 1962, livestock purchased in Sioux City went to 40 states and 175 cities.

City officials were unable to forecast the full impact on the economy of the loss of the $100 million formerly spent each year by Armour in the local areas of services, supplies, payroll and livestock. Mayor George Young said efforts were being made at all levels to get employment for the displaced and asked for cooperation of citizens to weather the storm.

COMMUNITY EFFECTS

An article examining the effect of the closing on the economy of Sioux City appeared in the Sioux City Journal the week that the plant closed. Highlights of this report showed there was "an amazing lack of concern by the general public as Sioux City prepares for the closing Sunday of the Armour and Company packing plant."

"There apparently has been no reduction in credit buying since the March announcement that the plant would be closed. It appears that people not directly affected are confident enough in their jobs and in the local economy to obligate themselves for periods of a year or longer," said the Credit Bureau manager.

The key question asked was: How would preparations for the loss of the plant pay off?

Officials anticipated an increase in the unemployment rate from 3.1 percent in April to 5 or 6 percent in July, and estimated this rate could rise even higher in 1964.

NATIONAL REACTION

Edward Salner, Division of Automation Manpower Services, U. S. Employment Service, personal representative of the Secretary of Labor, visited Sioux City in May, 1963. His role was to provide technical guidance by drawing on experience from other places and, "in general to give every kind of help that we can in this particular situation."

Mr. Salner said the job of solving this problem, "not only should not be done but cannot be done from Washington. It is the local people who know the problem, face the problem and can act on it.

"This is not solely an employment service problem as we are involved mainly as technicians," he continued.

On June 1, 1963, the local union secretary wrote President John F. Kennedy, enlisting his aid in permitting surplus government commodities to be brought into Woodbury County as there were none at that time.

By the end of the week, the writer was assured that the President had received the letter and that it had been referred to the proper government agency for reply.

EMPLOYEES' ATTITUDES AND EFFECTS

The Armour workers became unemployed in a labor market with most unfavorable characteristics for blue-collar job seekers.

Several situations in Sioux City that have been difficult to overcome lie in the area of administration plus local labor market conditions and, of course, the unpredicability of displaced workers' reactions to training or job offers.

Private efforts at job placement were helpful in encouraging the displaced worker to overcome his first inertia and give him a sense of mobility and hope for possible new job opportunities in the labor market.

Sources of information leading to jobs included: friends and relatives; newspaper ads; public employment service; private employment service; contacted by another employer; contacted by union; direct application; self-employed; and radio and TV as public service announcements, time contributed by stations.

Approximately 130 persons between the ages of 55 and 62 applied for an early retirement pension and about 75 of them did accept pensions under the early retirement program.

About one-half of the Armour employees accepted their severance pay. Some employees used this money to finance their own business. Many others used it to pay expenses while searching for work. Severance pay had to be repaid to the company with interest if the worker accepted an Armour plant job.

While awaiting transfer to other Armour plants, the workers who signed up for T.A.P. (Technological Adjustment Plan) received payments of $65 per week from the company. These payments, a negotiated union benefit, began either from the time of unemployment or at the completion of the individual's vacation period, whichever was the latest. Allowances for moving costs were paid by the Armour Automation Fund. Most transfers did not take place until late in August.

The possibility of employment in new Armour plants has held out hope for some of the workers. They preferred to see what would develop for them. Some of these plant openings have only delayed the readjustment for many. As an example, when the West Point plant opened in Nebraska, 180 Armour workers agreed to transfer to this plant, but 110 of these returned shortly to Sioux City. They came "home to Sioux City."

MDTA PROGRAM

The Sioux City plant employees were the first to benefit from the start by the retraining available under the Manpower Development and Training Act.

MDTA is the tool that cushions the impact of a plant shutdown. The people without jobs are trained to fill jobs that currently are without qualified workers to fill them.

Around 450 displaced Armour workers initially indicated an interest in training. The majority of these individuals specified they would take training if: (1) the wage rate on the new job was equal to former wages, (2) the job would be in Sioux City, (3) the training would be provided in Sioux City, and (4) only if guaranteed a job after training.

A follow-up survey in April, 1964, of the 290 remaining unemployed Armour workers has further verified the specific conditions that must be met before they will consider training. A number indicated a specific occupation, such as carpenter, plumber, or heavy equipment operator for which they would take training. The recent amendments to the Act may now permit some to enter training on an individual basis.

The Iowa agency has made every manpower training class in Iowa available to these workers. Only four Armour workers accepted referral to training outside the area. This tends to bear out the information gathered in the follow-up interviews that the majority will only train in Sioux City for jobs in Sioux City.

The closing of the Armour plant had a softening effect on the over-all labor market in Sioux City. This has had a serious deterring effect on locating occupations for training where there would be reasonable expectation of employment. Sixty-one additional business firms closed in Sioux City the past year, which has not helped the situation. Estimated employment affected by these closings totaled 222, including 96 women. About 20 new places of business were opened during the same period employing 60 to 80 people.

Under the Manpower Development and Training Act, the Iowa Employment Security Commission determines the need for job training classes, selects the persons to be trained and takes responsibility for getting them into jobs after training. The State Public Instruction Department handles the educational part of the program.

The federal government allocated initially $61,000 for the two classes in auto mechanics and auto body repair. Unemployed workers taking the courses received a living allowance weekly during the training period. This allowance was equal to the Iowa average of unemployment insurance benefits and was paid only to trainees who were heads of families and met other requirements.

The Armour Automation Fund helped some workers who were not qualified for the federal training as well as provided some medical aid. The private fund, however, did not pay a living allowance for workers in training as the federal program provided.

Jobless workers in training outside the federal training program cannot receive unemployment benefits. The living allowance for qualified workers in the training program has been separate from the unemployment insurance program.

Under Iowa law, a jobless worker must be available for immediate employment to qualify for unemployment benefits. A worker attending school is not immediately available, so he is disqualified for unemployment insurance benefits.

Most states have similar restrictions, but a few have changed their laws to permit workers to receive unemployment benefits while in training.

Trainees are now allowed to work 20 hours a week while in training without any reduction in their retraining subsistence allowance.

Aside from the actual closing of the Armour plant as a conversation provoking topic, the MDTA program excited more comment in the press of Sioux City and Iowa. Many citizens were irate when they learned the cost of instituting trade programs for a few welders and auto body and fender men. One citizen was heard to proclaim loudly that a person could be sent to Harvard University on what it would cost per man to set up a federally financed training program. But, eventually even the irate could see that the cost of training men for jobs was small in comparison with the estimated cost of a life-long dole to the unemployed and unskilled worker. It was proved that a retrained worker would pay in taxes within three to four years the dollar amount of his training.

The local school board members had several changes of heart before allowing the MDTA program to use school facilities in the evening and graveyard shifts.

In February, 1964, the bulk of the 95 persons enrolled in these MDTA courses was former Armour employees:

Structural Draftsmanship, 52 weeks, Sioux City Area Technical School
Machine Operation (two courses underway), 50 weeks, Central High School
Welding, 16 weeks, Central High School
Auto Mechanics, 50 weeks, Central High School
Meat Cutting, 24 weeks, local meat market
Clerk-Stenographer (two courses underway), 40 weeks, local business college
Hairstyling, 48 weeks, local beauty school

The Sioux City Sunday Journal for February 2, 1964, published a feature article on the MDTA classes being set up in Sioux City under the headline, "Willing Hands Train for New Careers." A review of the MDTA program was included in the article.

"What's happening is that Sioux City is well on its way to becoming an area vocational training center. Nebraska and South Dakota are both eager to send trainees to us but right now, with the Armour problem still not taken care of, we can't take them," said Gus Hahn, local Employment Service manager. "These vocational education facilities and the ability to train skilled labor will be a definite enticement for industry to locate in Sioux City.

"A manufacturer who plans to locate here one year from now can come to the ES and tell us the skilled workers he will need and we can have them for him."

Of the 15 former Armour employees in the first section of the welding or machine tool operator course, 10 were employed immediately upon completion of the course. Some of the jobs for welders that summer were disrupted by a two-weeks' carpenter strike.

By December, 1964, 28 former Armour & Company employees were enrolled in Sioux City MDTA courses. They were trained as machine operators, clerks-general office, meat cutters, automobile body repairmen, practical nurses, stenographers, automobile mechanics, household appliance repairmen, and welders. Fifty-eight potential trainees were screened by the local office in November and 34 referrals to training were made. Three new classes were started in November to train 25 men, including four ex-Armour workers, as household appliance repairmen and welders, and 20 women as clerk-stenographers. The trainees' ages ranged from 40 to more than 60 years. A few additional ex-Armour workers enrolled in the machine operator class started later in December. The first section of a statewide program for farm equipment mechanics also began in December, with new classes for meat cutters and clerks-general office planned for January, 1965.

The facts reported in this case book point up the importance of recognizing that what can be accomplished by retraining is closely related to the general availability of jobs. However, the Employment Service has developed techniques for finding job openings.

In conclusion, an important element in getting the person to seek or accept a job in the occupation for which he was trained means that the placement process may have to extend well beyond the time after a person finishes his course.

THE ARMOUR AUTOMATION FUND COMMITTEE—BACKGROUND

Armour & Company has closed more than 20 of its older plants since 1953.

The Armour Automation Fund Committee, formed in 1959 to cope with problems caused by plant automation, is supported jointly by Armour and the United Packinghouse Workers and Amalgamated Meatcutters unions. The committee is made up of ten members: two representing the public; four representing Armour management; two representing the United Packinghouse Workers Union and two from the Amalgamated Meatcutters Union.

The facilities of the Armour Automation Fund were used during the closedown of only two plants before Sioux City. In 1960-61 the first attempt was made at Oklahoma City, Oklahoma, to help former employees qualify through training for new jobs. The results were regarded as ineffective with more than half the ex-workers still out of work a year after the shutdown.

In the 1962 closedown of the Fort Worth, Texas, plant, the Fund facilities were more successful with the result that only a third of the employees remained unemployed one year after the shutdown.

On June 13, 1963, the Armour Automation Fund Committee opened an office to assist the Sioux City ES office staff with training and placement of those workers who did not accept transfers to other plants.

Through the Armour Automation Fund, 33 persons interested in specific training courses received paid tuition.

The local Employment Service office did the testing and counseling of persons whose training was financed by the Automation Fund Committee. Records including the GATB score, counselor's evaluation and the interest check list were forwarded to the Fund for action.

Relations with the Armour Automation Fund Committee and the Iowa State Employment Service and the local Sioux City office have been termed excellent by Fund officials.

Leadership and personnel in the local ES office were found to be "adaptable and intelligently innovative."

The local ES office showed the Automation Committee what can be done through constructive cooperation between public and private agencies, and these lessons would be applied in other cities including the later Kansas City shutdown, according to a spokesman for the Automation Committee.

SIOUX CITY TODAY

Sixty-one additional firms closed their doors in Sioux City in the 1963-64 period following the closing of the Armour plant. Through the joint efforts of the local ES office, the community and the Armour Automation Fund Committee, the 1,100 unemployed Armour workers on June 16, 1963, were reduced to less than 300 by April 30, 1964.

All in all, the worst was over, with the employed total up one year after the closing of the Sioux City Armour plant. By June, 1964, the number of unemployed persons in Sioux City had decreased to the approximate level existing before the closing of Armour & Company in June, 1963.

"For the last nine months, unemployment in Sioux City has been higher than usual; and now the level is about the same as before the close of Armour & Company. I'm optimistic about the future, although there are still about 300 former Armour employees without jobs," stated the local ES office manager in an interview published in the Sioux City Journal.

"Construction of new meatpacking facilities in the city and in prospect nearby indicate employment recovery for this industry seems in store in the near future," wrote the Sioux City local ES office manager in August, 1964.

Two-thirds of the persons laid off are still in Sioux City. They have one thing in mind, supporting their families. Some stayed away from home as long as a year for retraining so they could find work. About 630 men and women have found jobs with the assistance of the ES and the Automation Committee. Four hundred are working in Sioux City. Two hundred are unaccounted for; either they have retired or have found jobs elsewhere without reporting to the ES.

Sioux City has weathered the storm. Latest employment figures are unusually bright for the winter slump period and predictions for spring and summer '65 are, to say the least, optimistic.

That the community has been successful is supported by the fact that the methods Sioux City has used to get work for unemployed workers were used by officials at South Bend, Indiana, when the Studebaker plant closed there. The triumph is summed up rather modestly by ES manager, D. W. "Gus" Hahn who says, "With plenty of people staying here, it speaks well for the town."

SUMMARY

Advance planning, extensive interviewing, testing and counseling, retraining programs and enlisting community support were required to meet the critical problems of those people unemployed in Sioux City through the closing of a major plant, Armour & Company.

Much work has been done in the Sioux City community, and continued work will need to be done in order to successfully return to the productive labor market all ex-Armour workers who want to work.

Recent interviews indicate that the hard core of unemployed workers will be even more difficult to assist. The remainder now represent the older group (over 45 years of age), less educated, less inclined to leave the area, and least adaptable to new job situations. Latest figures (April, 1965) show 133 are actively seeking employment through the local Sioux City office.

The job that remains to be done will probably not require any new technique, but will require concerted effort on the part of the Employment Service and the community. In the area of retraining, the multiple occupational approach to the training of groups of 50 unemployed persons may be the technique that will give adequate assistance to developing skills of the remaining hard-core unemployed.

The problem of plant closing and resultant mass unemployment is not new, and will continue in the future. Out of past experience, it is hoped that future problems will be better understood and solved effectively.

These points are considered the most critical in handling successfully the problems caused by any major plant closing:

1. The speed with which a preplanned program is activated after closedown announcement can be debated. The displaced workers may be numb with shock and will not cooperate with efforts to find new employment for them. Delay on part of community leaders may result from efforts to keep the plant open. Other troubles could stem from lack of speed on decisions by management. Management and union must cooperate fully in programs to help displaced workers.
2. An efficient and well-accepted Employment Service can do much to alleviate the problems of the unemployed through interviewing, testing, counseling, training and placement. Top interviewing techniques must be used. Vital information about the unemployed has to be carefully gathered, weighted, evaluated and summarized. Lack of access to payroll forms and other sources of personnel information slowed down effective employment service practices. Project experience should be integrated with regular operations of the Employment Service office. Involve state and local office specialists such as counselors, employer relations representatives, occupational analysts and labor market analysts—all have contributions to make to this program of finding new work for displaced persons. The Employment Service team approach seems to work best in arriving at a partial solution to the unemployment problem.
3. The entire community must be made aware of the problems caused by plant closings, and all community groups must participate in order to aid unemployed in particular and the economic life of the area in general. Enlist the cooperation of local organizations and local, state and federal government agencies, the school system, particularly vocational education. Each organization or agency can provide valuable assistance at different stages of the project.
4. The level of general unemployment in the area has direct bearing on whether the displaced workers can be readily absorbed by other employers.
5. Good relations with press, TV and radio stations proved to be important to all segments of the program to aid ex-Armour workers.
6. Sioux City officials and management had the benefit of experiences of previous Armour meatpacking plant closings and were able to plan and to do more for the unemployed.
7. The retraining of workers is a positive approach to the solving of individual problems when new skills must be learned in order to find another place in the labor force.

*PROGRAM DEVELOPMENT; *VOCATIONAL REHABILITATION; HANDICAPPED
GUAM

Initiated in 1958 with the establishment of a workshop to train the retarded and severely disabled, the Vocational Rehabilitation Division presently has a staff including a chief and three counselors. A new facility for the retarded opened in February, 1966, and a pre-vocational program for clients with tuberculosis is beginning. The incidence of disability and the needs of the disabled will be determined in a door-to-door survey in all villages and in the remote jungle from January 1967, to June 1968. Plans for the future include a hearing aid distributorship and a selective service rejectee program. (JK)

VOCATIONAL REHABILITATION IN AMERICA'S OUTPOST IN THE CENTRAL PACIFIC

Struggling to overcome a 40-year time lag in starting the wheels of rehabilitation in motion, the Guam Vocational Rehabilitation Division is proud of its present progress and of the cooperation of its local citizens and government. The program now boasts a chief, three counselors, a workshop training 50 clients, three vending stands, and a rapidly increasing case load. The island has over 85,000 inhabitants spread over 209 square miles, but only about 50,000 are eligible for VR service. Aliens and military personnel comprise the remaining number.

On an island 6,000 miles from the U.S. mainland and in an area considered by some to be part of the orient, some differences in program and approach naturally occur.

One of the biggest problems in starting the program was to convince the people that the disabled could and should work. The Guamanian people have a long history of family cohesiveness. Any family member in better circumstances helps the one less fortunate without question. The disabled member of the family was often given no formal schooling and was taught little or no skills with which to support or help himself.

VT004949

When the program was started in 1958, it was decided to establish a workshop to train the retarded and the severely disabled. As often happens, the original concept is the one remembered longest, so many local people still feel that the VR program is still chiefly concerned with the training of the retarded. Gradually this impression is being changed as other programs are initiated and developed.

The island is composed of 22 major villages, each with an elected commissioner, a church, public health facility and, for some, a fire department and public elementary school. The houses in general are not numbered nor are they arranged along streets. Although future plans will remedy this situation, at present the best way to contact a client is to visit the commissioner's office and ask him to locate the person for you.

The island has a small college which, in 1963, was changed from a 2-year to a 4-year institution. Guam Trade and Technical School opened the doors of its new facility in October, 1966. Additional educational programs in operation include MDTA, OEO, Adult Education, NYC and others.

The VR counselor must improvise, use his wits, overcome a language handicap, correspond with facilities thousands of miles away, and still rehabilitate the disabled.

Statewide planning for the disabled on the island will be started in January, 1967 and will be completed in June, 1968. This will include a door-to-door survey in all villages and in the remote jungle to determine the incidence of disability and the needs of the disabled.

Guam is located in the Western Pacific in a region which is tropical and always warm and humid. A counselor doesn't have trouble with his car getting stuck in the snow, but he might turn around and find it rusted away to a few nuts and bolts. Then the road he planned to take that looked passable last month may be overgrown today with tropical vegetation.

Some medical and prosthetic facilities are not available on Guam. Clients are often sent to Hawaii (3,300 miles) or to the U.S. mainland for an artificial limb or a hearing aid. Clients requring heart surgery, special therapy and some types of training must also be sent to the Continental United States.

There are no institutions for the blind, for the deaf, or for the emotionally disturbed on the island. The program of pre-vocational training for clients with tuberculosis is just beginning. A new facility for the retarded opened in February, 1966.

The island is slowly picking up the pieces after 4 years of Japanese occupation in World War II and Typhoon Karen in 1962 which destroyed 90% of the homes. VR is one of the agencies supplying the spark for better things to come. A spanking new workshop-office complex was opened in

1966. A new bus was purchased in September 1966 to transport clients from the southern end of the island to the workshop, a distance of roughly 30 miles.

Guamanians are bilingual, speaking chamorro, which has many added Spanish words and use English as a second language. Few clients qualify for college training. The majority of public school teachers is from the mainland. One saving grace in the VR picture is the healthy supply of unskilled and semi-skilled jobs available. The military, with its diverse projects, has many unfilled jobs for which civilians are eligible.

Other troubles are a minor flood now and then during the rainy season or maybe a typhoon or tidal wave to battle about mid-year. But the VR message is being carried to every corner of the island. Among other things, the division hopes to establish a hearing aid distributorship, a new vending stand, a selective service rejectee program, and a OASIDI determination unit on the island. Adios, for now.

ARKANSAS; MDTA PROGRAMS; *MANPOWER DEVELOPMENT AND TRAINING ACT PROGRAMS

The purpose of this booklet is to assist counselors, school administrators, teachers, and others who have occasion to advise youths and adults concerning the availability, of public and private educational institutions in Arkansas offering approved vocational business, distribution, industrial and technical day school courses of less than baccalaureate degree level. Listings of approved Manpower Development and Training Act (MDTA) programs and registered apprenticeship programs are also included. More than 45 senior high schools offer approved, trade preparatory, vocational education courses as an adjunct to their curricula. Moreover, as of 1967, there are two area vocational-technical senior high schools operating and one area adult vocational school, and the State Board for Vocational Education is operating or has under construction 10 state vocational-technical schools. Major assistance for training operators and production workers is provided through MDTA programs. To provide higher skill level training, there is the Southwest Technical Institute, administered by the State Board for Vocational Education, as well as two community junior colleges, one four-year college, and numerous private schools. FOREWORD

The University of Arkansas' Industrial Research and Extension Center staff has estimated that from 1960 to 1980 total employment in the State will increase between 30 and 45 percent. In terms of the number of new jobs expected, the largest increases will occur in manufacturing, and in wholesale and retail trade. The increases will depend, to a large extent, on the availability of trained workers for the expansion of industry and business. This suggests that the State must not only provide education and training facilities, but also, that concerned individuals must make an effort to encourage both youths and adults to prepare for the positions of the future.

There are in Arkansas a number of public and private schools, training institutions, and private businesses that offer vocational training opportunities to youths and adults. More of these facilities will be provided in the future. One of the problems encountered is that of acquainting the present or prospective worker who is in need of training or retraining with the various facilities and programs available, and to encourage these persons to take advantage of the opportunities provided. This booklet is designed to provide some assistance in overcoming this problem.

The listings in this booklet contain the names of the approved vocational business distributive, industrial and technical day school courses of less than the baccalaureate degree level offered in public and private schools and training institutions in Arkansas, and approved Manpower Development and Training Act programs and registered apprenticeship programs in the State. The listings were compiled by Dr. Roy Roberts, Professor Emeritus of Vocational Education, University of Arkansas from reports of the various State agencies that have responsibility for approving education and training programs for youths and adults in Arkansas.

The booklet is designed to assist counselors, school administrators, teachers, ministers, business and professional persons and others who have occasion to advise with youths and adults concerning the availability of schools and other educational institutions in Arkansas. It is hoped that these listings will be useful to such advisors in supplying information to both youths and adults who are in need of further training.

I
INTRODUCTION

A labor force capable of participating in a modern industrial society is recognized as one of the essentials for rapid economic development. A program of education and training to meet this need in Arkansas is being developed by the State Board for Vocational Education, in cooperation with the State Board of Barber Examiners, the Arkansas Board of Cosmetology, the State Board of Nurse Examiners, the Employment Security Division, and the Bureau of Apprenticeship and Training, U.S. Department of Labor.

Vocational education and training programs to meet the State's needs include the following:

1. Development of a supply of workers with a foundation of education, theory, and skill in skilled and technical occupations.
2. Training of clerical workers, operators, and production workers for new or expanding industries.
3. Continuing programs of evening, extension, and off-the-job courses to upgrade and update apprentices, experienced workers, and supervisors.

All programs in the three areas are planned and operated with the advice and counsel of an advisory committee representing the particular industry or occupation.

Skilled and Technical Workers

More than 45 senior high schools in Arkansas offer approved, trade preparatory, vocational education courses as an adjunct to their regular curricula. Also, there are two Area Vocational-Technical Senior High Schools currently operating in the State, along with one area adult vocational school.

In addition, the State Board for Vocational Education is operating or has under construction 10 State Vocational-Technical Schools which offer full-time preparatory or pre-employment courses to people from all areas of the State.

The graduates of these schools, while they are not finished technicians or mechanics, are well grounded in basic skills, applied math, science, and theory of occupations. They can begin work without the full-time supervision and training required for untrained workers.

To provide more sophisticated and/or higher skill level training, the Southwest Technical Institute, administered by the State Board for Vocational Education, is scheduled to open in September 1967. Also providing this type training are two community junior colleges, one four-year college, and numerous private or proprietary schools.

Operators and Production Workers

The major assistance for these semiskilled workers are provided through programs authorized by the Manpower Development and Training Act (MDTA). This Act also provides for courses to meet special needs of an area. These courses are based on needs or employment opportunities as determined by the State Employment Security Office.

Supplemental Instruction for Employed Workers

Courses for apprentices, journeymen, other industrial workers, and supervisors are provided in any area where needed to provide the necessary technical or related knowledge to upgrade or update present workers.

Organization of the Booklet

This booklet is in four sections. Section II contains the names of the approved vocational business, distributive, industrial and technical day school courses of less than baccalaureate degree level offered in public and private schools and other educational institutions in Arkansas. Section III includes a brief description of the Manpower Development and Training Act together with a list of the MDTA classes now in operation in the State. Section IV contains some comments about registered apprenticeship programs and a list of trades and places in Arkansas in which registered apprenticeship programs are in operation.

The listings do not include all vocational education programs in the State. About 300 school districts maintain departments of vocational agriculture and departments of vocational home economics which are not included in this list. Many schools offer shorthand and typewriting but only those that have been approved for federal reimbursement are listed.

II

LIST OF APPROVED VOCATIONAL BUSINESS, DISTRIBUTIVE, INDUSTRIAL AND TECHNICAL DAY SCHOOL COURSES OF LESS THAN BACCALAUREATE DEGREE LEVEL OFFERED IN PUBLIC AND PRIVATE SCHOOLS IN ARKANSAS

The following section lists the vocational course offerings of schools in Arkansas. The listings include both public and private schools. The private schools are designated by the abbreviation (Pvt.) following the name. All other schools are public institutions Some schools are scheduled to open in September 1967. These are designated (1967-68)

Senior High Schools

These schools offer courses for students who are regularly enrolled in the school designated. These students are not charged tuition. Students who do not reside in the local school district, however, are required to pay a tuition or registration fee. The vocational courses in the senior high schools and the Arkansas schools for the blind and deaf are a part of the regular high school courses of study and carry high school credits that may be used in partial fulfillment of the requirements for the high school diploma.

Area Vocational-Technical High Schools

These schools (Little Rock - Metropolitan and Fayetteville - Sequoyah Polytechnic) are administered by the local public school boards in the districts in which the school is located. The two schools are designed to serve an area comprising several local school districts Students who reside in the school district in which the school is located are not required to pay tuition, school authorities in the other school districts may make financial arrangements with the technical school district authorities for students from the outlying districts to attend this school. These technical high school courses are two year courses (grades 11 and 12) and carry high school credit The shop classes meet three periods per day, one section in the morning and one in the afternoon Students spend one-half day in shop classes and one-half day in related or other classes

Little Rock Adult Vocational School

This school is administered by the Little Rock public school district, and is designed to provide elementary and secondary remedial education as well as vocational training.

Students over 16 years of age from any part of the State, who can profit from courses offered, may attend. Both day and evening classes are offered. Tuition and fees are charged, however, tuition is nominal and fees are primarily for materials.

State Vocational-Technical Schools

These schools are administered by the Arkansas State Board for Vocational Education under Act 328 of 1957, with separate appropriations for each. Students over 16 years of age from any part of the State may attend any one of these schools. Students who desire admission are required to (1) file an application, (2) complete a General Aptitude Test Battery administered by the Employment Security Division, and (3) pay the first quarter's fee. The tuition fee is $15 per quarter or $60 per year. Most of the courses are one year (48 weeks) in length. Other courses vary in length from 5 to 24 months. Classes are in session 6 hours per day, 5 days per week. Some schools operate school buses for transporting students. Trainees who complete a course of study are awarded a certificate. The school assists in the placement of graduates.

The Southwest Technical Institute

This school, located at Camden, Arkansas, is scheduled to open in late 1967 or early 1968; it is administered by the Arkansas State Board for Vocational Education. The high school diploma or the equivalent is required for entrance. Most of the courses are highly technical and are two years in length.

Community Junior Colleges

Currently, Fort Smith (Westark) and Helena (Phillips County Community College) are the only two community colleges in the State, they are administered by seperate boards of Trustees appointed by the Governor. The tuition charge is $75 per

semester for resident students and $150 per semester for non-resident students plus some other fees. In general a high school diploma or the equivalent is required for admission. A student may enter some courses by satisfying the college authorities that he has the ability to succeed in the course. Most of the courses are two years (72 weeks) in length.

Arkansas Agricultural, Mechanical and Normal College

This college, located at Pine Bluff, Arkansas, offers one- and two-year terminal courses of less than baccalaureate degree level in a variety of trades. The courses are open to persons 16 years of age or older who have completed the eighth grade or its equivalent and can profit from such courses. A satisfactory rating on the General Aptitude Test Battery administered by the Employment Security Division is required of all applicants. Tuition and fees are about $73 per academic year. Students receive appropriate certificates upon satisfactory completion of a course.

Private or Proprietary Schools

These schools are owned by individuals or corporations, and supported by fees or tuition charges. Entrance requirements vary among the schools but in general a high school diploma or the equivalent is required for admission. Students whose abilities and qualifications seem to be such that they can successfully complete the courses of study may be admitted by special arrangement. Courses vary from one to two years in length with a few courses in specific skills of less than one year. Fees and tuition vary according to school and courses.

Most of the institutions listed offer evening classes for workers who are employed during the day. Also, many of them offer courses in general adult education to enable students to read and write and acquire the general learning abilities needed to learn a trade or retrain for a new trade.

Finally, curricula of all schools change with changing demands, therefore, it is important to note that the curricula listed are current offerings and offerings planned for the 1967-68 school year.

III
MANPOWER DEVELOPMENT AND TRAINING

The Manpower Development and Training Act (MDTA) of 1962 was designed by Congress to reduce unemployment by training and upgrading eligible trainees. Persons eligible for training are selected from the unemployed or underemployed labor force who reside in counties in need of manpower development. Youths 16 years of age and low income farmers in need of training may be eligible. Federal funds are available for paying stipends to trainees.

Trainees are selected by the Employment Security Division. This Division also has responsibility for designating the occupations for which training may be given, and for the administration of the program. Stipends in the amount of $29 per week plus allowances for dependents and other stated costs are paid to the trainee by the Employment Security Division.

The Arkansas State Department of Education has responsibility for conducting the training programs. The department may organize classes, secure facilities and employ instructors or it may contract with public and private schools and colleges for in-school training. The regulations provide for training of less than class groups by which one or more individuals may be placed in an ongoing course. Basic education (reading, writing, and arithmetic) may constitute a part of a course if it is needed to enable this student to make progress in his course. The courses range from about 700 to 2000 clock hours in length.

The department may also contract with business establishments for on-the-job training (OJT) On-the-job training may be defined as the actual performance of work duties in any occupation, under the supervision and guidance of a trained worker or instructor. If an employer will provide job entry training to unemployed persons, or provide skill improvement training, or retrain workers whose skills have become or are becoming obsolete, and the employer cannot find an adequate number of persons to fill such skill requirements, the Federal Government will:

1. Reimburse job instructor fees
2. Pay for materials used in training
3. Pay for instructional supplies

4. Provide consultation and advice on training programs
5. Assist in developing training programs
6. Recruit job applicants
7. Arrange for group training for small shops
8. Arrange for area-wide training programs

Arkansas had a total of 112 courses in 83 projects in operation during the year 1966. These courses were in 19 cities and had a total enrollment of 2,522 students. Thirty-six of these courses with an enrollment of 909 were in Little Rock. The courses more frequently offered included: practical nursing, auto mechanics, stenography, electronics technician and laboratory testing.

The following courses were in operation in Arkansas as of January 1967:

AUTOMOBILE BODY REPAIRING

Fort Smith

In addition to the above organized classes there were 131 MDTA trainees enrolled in less than class groups in the State.

The Director of MDTA Programs, Arkansas State Department of Education, State Education Building, Little Rock, Arkansas, will supply further information on request.

IV
REGISTERED APPRENTICE PROGRAMS

Apprenticeship, which consists of learning a trade on the job under supervision and according to established specifications, is the earliest form of vocational education. The Babylonian Code of 2100 B C. included legal provisions for apprenticeship. The guilds of the Middle Ages depended on organized apprenticeship programs not only for teaching workers a trade but also for their general and often religious education. The first form of compulsory education in Colonial America was contained in the early apprenticeship laws.

Apprenticeship went into a decline during the industrial revolution and expansion of the factory system in the latter part of the eighteenth century. However, in recent years a renewed interest in apprenticeship has appeared. The National Apprenticeship Act was passed in 1937. This Act established the Bureau of Apprenticeship and Training in the U. S. Department of Labor. This Bureau endeavors to make the public aware of the need for apprenticeship and training and to encourage employers, labor organizations, and individuals to take appropriate action and insure a balanced number of skilled workers. It also encourages labor and management to adopt policies and procedures that will create a favorable climate for the development of apprenticeship and skill improvement programs. Provision was made for a voluntary registered apprenticeship system that has maintained acceptable standards and has received recognition by labor, management and government in much the same manner as an accredited school or college is recognized.

Most registered apprenticeship programs are operated by a local joint apprenticeship committee. This committee is composed of an equal number of persons from labor and management from the trade for which the apprenticeship program provides training. This committee has responsibility for selecting apprentices, establishing the course of study or schedule of work processes, determining the length of the apprenticeship period, fixing wages of apprentices, providing supervision on the job and related training in a classroom, and determining when the apprentice has completed his apprenticeship.

Apprenticeship Standards

The local joint committee operating a registered apprenticeship program is guided by state and national standards. Among these standards are age limits, usually 18-26 years of age; years of schooling, usually high school graduate or the equivalent; related instruction of not less than 144 clock hours per year; a progressively increasing wage scale, averaging not less than 50 percent of the journeyman's wage for the occupation; a schedule of work processes; adequate supervision; and provision for review and registration of the program.

Application for Apprenticeship

The candidate for apprenticeship is required to make a written application to a representative of the local joint committee. The application should include the age of the applicant, a transcript of his high school credits, and the results of a general aptitude test battery. If the joint committee decides that the applicant is a likely candidate a personal interview will be arranged. If accepted, the apprentice must successfully complete a probationary period before final acceptance.

The Bureau of Apprenticeship and Training, U. S. Department of Labor, 3006 Federal Office Building, Little Rock, Arkansas, or the local office of the Employment Security Division can supply the prospective apprentice with the name of the representative of the joint committee for the trade in which he desires to apply for apprenticeship training.

The apprentice spends from three to six years in the program, depending on the trade for which he is apprenticed and his aptitude, ability and diligence. Through collective bargaining the registered apprenticeship program is financed by labor and management and this program provides a means whereby a young person may learn a useful and profitable trade while earning a living.

Registered apprenticeship programs for the following trades are presently in operation in Arkansas. Some of these programs are for apprentices in one city, some for apprentices in two or more cities or areas, some are statewide and some are operating for apprentices in a larger establishment.

Guidelines for Compiling a Directory of Community Services in Rehabilitation and Employment of Handicapped Men and Women.

The President's Committee on Employment of the Handicapped, Washington, D.C. Women's Committee
MF AVAILABLE IN VT-ERIC SET.
Pub Date - Apr66 13p.

*REHABILITATION PROGRAMS; *HANDICAPPED; *DIRECTORIES; *GUIDELINES; QUESTIONNAIRES

In developing a directory that will assist in community planning, (1) objectives must be developed, (2) consideration must be given to the current existence of directories and the adequacy of their contents, and (3) decisions must be made regarding data collection, the kind and amount of information to be included, the geographical area to be included, financing of the project, utilization of the information to determine gaps and duplication, and responsibility for up-dating. A questionnaire to elicit information to be included in the directory and suggestions for organizing the directory are presented. Pertinent references are indicated. (JK)

FOREWORD

In every well-run business there is a time for taking stock before the planning and the purchasing is done for the next year. Stock-taking also works well in community planning for the rehabilitation and employment of handicapped men and women. This is especially true in communities where citizens are aware of the scope of the problem and are willing to take time to become personally acquainted with existing services for the handicapped. A background of information of this kind is an essential first step in developing adequate tax-supported and voluntary programs to help handicapped persons gain independence and make it possible for them to use their skills in employment.

The national organizations represented on the Women's Committee have enormous potential, through their local units, for getting at the facts in rehabilitation and employment at the grassroots. In many communities the compiling of a directory can be a cooperative venture by organizations represented on the Women's Committee, local representatives of the Governor's or the Mayor's Committee on Employment of the Handicapped, and professional workers in the fields of health and welfare.

We hope to feature the results of this project at our 1967 Annual Meeting by an exhibit of community directories and by suitable recognition for communities doing outstanding work. Further information about the Community Directory Competition may be obtained from the Women's Committee.

Congratulations and good wishes to the Women's Committee in launching this project and in all of their undertakings.

HAROLD RUSSELL
Chairman, The President's Committee

INTRODUCTION

Objectives in Compiling a Directory

The time spent in listing objectives before starting a community project, especially the compiling of a directory, will pay high dividends. This publication, GUIDELINES FOR COMPILING A DIRECTORY, lists some items to be considered.

To keep the project within reasonable boundaries, this publication will focus on services available for the vocational rehabilitation and employment of handicapped adults. Some community groups may wish to broaden the scope of the directory to include other age groups and a more comprehensive list of services.

After considering the scope of the overall problem it may be found advisable to plan separate directories on specific major problems for the convenience of the people for whom the directory is intended. The list of references on pages 7 and 8 will indicate how other communities have dealt with this problem.

Suggested Objectives

1. To give citizens concerned with rehabilitation and employment a first-hand contact with tax-supported and voluntary agencies serving the handicapped in their community or on a county or regional basis.

2. To become more aware of the gaps in the services offered and in apparent duplications. This awareness is needed for program planning.

3. To develop a classified list of rehabilitation and employment services available, along with a brief description of how each service may be obtained.

4. To publish a simple directory of "Services in Rehabilitation and Employment," available to handicapped persons and their families and to interested laymen and professional workers.

WHAT SERVICES ARE AVAILABLE? WHAT SERVICES ARE NEEDED?

I. BEFORE STARTING A DIRECTORY CONSIDER THESE ITEMS

A. Do local, regional or State directories of any kind already exist?

Consult your library, the county medical society, the home economics extension service of your county or your State Land Grant College or University, and the offices of tax-supported or voluntary agencies concerned with any aspects of the handicapped -- rehabilitation, employment, health, welfare, education, recreation, cultural opportunities, architectural barriers, etc.

B. Do the directories include up-to-date information on opportunities for rehabilitation and employment? Should they be supplemented?

Each community must decide which disabilities to include in a directory. The following list has been adapted from the Rehabilitation Survey Bulletin of the American Medical Association.

Amputations, arthritis, blindness or visual defects, cancer, cardiovascular diseases, cerebral palsy, cosmetic disfigurement, deaf and hard of hearing, diabetes, epilepsy, hemiplegia, mental retardation, mental illness, multiple sclerosis, muscular dystrophy, orthopedic, paraplegia, poliomyelitis, speech defects, tuberculosis, others.

C. Do the directories include services that may not be available locally but are available on a regional basis?

Look for such regional facilities as hospitals, rehabilitation services and centers, sheltered workshops, Goodwill Industries, health and welfare services, and employment offices.

D. Have pertinent Federal services available to States and local communities been listed? (See References 12, 13, 14.)

E. Do the directories include services needed but often neglected?

Examples of services often neglected: (1) Vocational rehabilitation for handicapped homemakers; (2) opportunities for gainful employment for homebound persons; (3) sources of temporary help in child care and housekeeping chores such as Homemaker Service; (4) sources of loan, rent or purchase of wheelchairs, crutches, hospital beds, etc.; (5) beauticians and barbers making home visits; (6) sources of information on home planning and remodeling to suit disabilities; and (7) sources of information on housing legislation concerning the handicapped - nearest office of the Department of Housing and Urban Development can help.

F. Is there a telephone number listed for an information center that can be used by those who are uncertain about where to obtain information?

II. SOME DECISIONS TO BE MADE IF A NEW DIRECTORY SEEMS NECESSARY

A. What will the directory cover and who is likely to use it?

B. Who will collect the information?

Will it be done by volunteers or by paid workers?

Will it be done by personal visits or by correspondence?

Could the making of the directory be a cooperative community project? Are there other organizations that might be interested in working with you? Are there professional workers willing to help? (See page 8 for examples of cooperative projects.)

C. How large an area will be included in the directory?

What are the boundaries of the geographical area to be included? A town, a county, a city, or a metropolitan area?

What age range will the directory include?

How many handicapped men and women live in the area covered by the directory? (Consult such agencies as the departments of health and welfare, the vocational rehabilitation office, and professional workers in the field.)

How many handicapped persons are now employed in the area to be included in the directory? (See the nearest employment service, the vocational rehabilitation office, or write the Governor's or the Mayor's Committee on Employment of the Handicapped.)

D. How much information should the directory include?

Who will prepare the directory information form? (See page 5.)

Which disabilities will be included? (See page 3, I-B.)

Who will edit and compile the directory?

What provision will be made to enable organizations concerned to check their descriptions for accuracy?

E. How will the compiling and the distribution of the directory be financed?

Consider items such as stationery, typing, postage, telephone, printing, mimeographing. It is assumed that the visits to agencies to obtain information for directory forms will be done by volunteers.

F. After getting a clear picture of the services now available, how will the gaps and duplications be determined?

G. Who will be responsible for keeping the directory up to date?

III. SUGGESTED QUESTIONNAIRE FOR INFORMATION TO BE INCLUDED IN DIRECTORY.

The most readable directories are brief, concise, in simple language and in outline form.

1. Name of agency or organization.

2. Address.

3. Telephone.

4. Purpose (Brief description).

5. Specific services for the <u>rehabilitation</u> of handicapped persons.

6. Specific services for the <u>employment</u> of handicapped persons.

7. Geographic area served.

8. Eligibility (Who may receive services?)

9. How to apply.

10. How is the agency financed?

11. What is the cost of the services to the handicapped person?

IV. SUGGESTIONS FOR ORGANIZING THE DIRECTORY MATERIAL FOR PUBLICATION

The form will depend on the size of the directory, the plan for distribution, and the finances available. (Send for samples listed on pages 7 and 8.)

A. Include this information on cover or title page:

1. Type of information contained.
2. Geographical boundaries of the area included.
3. Sponsors for compiling and distributing the directory.
4. Date of publication.
5. Where directory may be obtained. The cost if any.
6. Acknowledgments.

B. Table of contents and index

1. List all organizations and agencies included in the directory. Give the page reference.

2. Use a suitable symbol such as (T) or (V) to indicate which agencies are tax-supported and which are voluntary.

3. List agencies according to the type of service available.

An example, from the Chicago Physicians Directory of Rehabilitation Services and Facilities:

Psycho-Social

Domiciliary care	Psychological evaluation
Financial assistance	Personal adjustment counseling
Social case work	Psychiatric evaluation and psychiatric treatment

Physical Medicine and Rehabilitation Services

Nursing care	Coordinated comprehensive services
Physical therapy	Speech evaluation and therapy
Occupational therapy	Audiological evaluation and therapy

Vocational

Vocational guidance and counseling	Selected job placement
Vocational testing	Sheltered workshops
Work evaluation and work adjustment	Homebound work
Vocational training	

Special Treatment Resources

Alcoholism	Psychiatric
Blind and partially sighted	Mental retardation
Deaf and hard of hearing	Veterans
General information service on rehabilitation resources	

REFERENCES

In preparing these GUIDELINES, the Women's Committee studied scores of directories and consulted leaders of 35 national organizations. A few of the references follow. Prices listed in the publication are listed in the Reference. It may be possible to obtain some of the publications on request.

Background Information

The President's Committee on Employment of the Handicapped is made up of some 600 public spirited organizations and individuals, appointed by the Chairman in the name of the President.

Members may also serve on the following subcommittees which have special responsibilities:

Awards, Disabled Veterans, Employer, Labor, Library, Medical, Membership, Mentally Handicapped, Public Information, Public Service, Rural Areas, Student Competition, Workmen's Compensation, and the Women's Committee. The purpose of the Women's Committee is to utilize the many talents of women to promote employment opportunities for handicapped workers, and to develop programs and projects for women's groups to achieve this objective.

Three main projects are now being sponsored by the Women's Committee: the arts and crafts program --"Project Earning Power," the elimination of architectural barriers, and the rehabilitation of handicapped homemakers. This bulletin on GUIDELINES FOR COMPILING A DIRECTORY is one of the special projects of the Homemaker Group.

The Women's Committee is made up of presidents of a number of leading women's organizations in the country, and individuals with wide organizational experience. The Women's Committee will work closely with women's groups in planning programs and projects --

*To promote employer acceptance of handicapped men and women in jobs for which they have been prepared through vocational rehabilitation and for which they have qualified by experience, aptitude and training;

*To promote favorable attitudes toward these workers on the part of the general public;

*To make known available rehabilitation resources and services for disabled persons;

*To inform handicapped men and women of rehabilitation benefits.

Further information and lists of publications and exhibit material available will be furnished on request by The President's Committee on Employment of the Handicapped, Washington, D.C. 20210.

INTERINSTITUTIONAL COOPERATION; *ADMINISTRATIVE ORGANIZATION; *JUNIOR COLLEGES; *VOCATIONAL EDUCATION; *RESEARCH OPPORTUNITIES; SPEECHES; COMMUNITY COLLEGES; *SCHOOL ORGANIZATION; ORGANIZATIONAL CLIMATE

This paper is concerned primarily with the internal organization of comprehensive public community junior colleges. Two basic concerns of occupational education in community junior colleges serve as a basis for discussion: (1) Occupational education must be equal with other facets of the college program, and (2) The occupational education program must be integrated as thoroughly as possible with the rest of the colleges. Two organizational structures are proposed. The first proposed pattern would divide the college into two parts, each administered by a dean who is directly responsible to the chief campus administrator. The third and fourth levels might be divisions and departments. The unique element under this pattern, any one division would be responsible to both deans of the college. In the second proposed organization, the divisions would not be identifiable as either general or occupational. These divisions would be responsible to only one administrator, perhaps a Dean of Instruction or the President himself. The need for research growing out of these proposals is discussed and includes a definition of the objectives of college programs, effects of college organization upon the achievements of the institution, and research pertaining to faculty attitudes. Research Opportunities in Comprehensive Public Junior Colleges: Inter - and Intra - College Organizational Problems

Vernon L. Hendrix
University of Minnesota

The basic thoughts presented in this paper are concerned primarily with the organization of comprehensive public community junior colleges. Most of the suggested organizational patterns and implied research opportunities were developed at a conference sponsored by the Midwest Technical Education Center in St. Louis last May. Although the organizational patterns and research opportunities were originally generated to hopefully improve the operation of the junior college in occupational curricular areas, the results would obviously concern the total college and may be generalized beyond the original intended domain. When Jim first informed me of his interests in organizing this symposium, I had just finished participating in this conference and was still enthusiastic about the intra-college opportunities and implications for inter-college patterns and thus agreed to present these ideas. I must emphasize that these were produced by a number of people working as a team and are not my own original creations. I will accept complete responsibility for all generalizations and implications beyond the original area of concern, i.e., the junior college and more specifically occupational education.

Although the following comments deal with a variety of subjects, there appears to be one central theme which pervades, i.e., organization. The internal organization of colleges or sub-units within colleges is the most dominant aspect of this theme. It is apparent, however, that extra-college organization is also relevant. These remarks will, as much as possible, be limited to the purely

VT004955

administrative aspects of organization. The task of collating these more general statements with the more specific demands of areas such as curriculum and student personnel services will not be treated here. The relationships should be quite obvious, but time prohibits any attempt to make them explicit.

PROBLEMS

Two basic concerns of occupational education in community junior colleges serve as a basis for this discussion. First, occupational education must be equal with other identifiable facets of the college program. Research by sociologists in the areas of prestige and status would seem to indicate that this is an impossible task. Within the context of society, perhaps this is the situation. Within the context of any particular college, the task is difficult but not impossible. Although the reality of this problem is recognized by everyone connected with community colleges, the existence of a few exemplary institutions indicate that equality can be achieved. Second, the occupational education program must be integrated as thoroughly as possible with the rest of the college. This has obvious implications for curriculum planning and staff utilization. Also, integration and equality are obviously related. In general, where one is found to exist, the other is likely to be found also. Any attempt to maximize one of these must, however, take the other into consideration.

It is also recognized that the "ideal" organization for a college cannot be determined by strictly internal considerations. For example, state governmental structures may determine certain aspects of the college organization or set certain restrictions. In many states the methods by which federal and state funds are disbursed dictate certain aspects of the college organization, or require the presence of certain identifiable positions, or require that persons holding certain positions have certain characteristics, etc. These requirements and restrictions are often completely unrelated to the tasks the college is attempting to achieve.

Concerning administrative structure and organization, in general many of the recommendations proposed at the conference were to achieve equality for occupational programs and to promote greater integration of occupational programs and staff with other programs in the college. In general, these recommendations reflected a desire to break away from "traditional" structures (e.g., traditional patterns in junior colleges, other institutions of higher education, secondary schools, business or public administration, etc.) and develop organizational structures relevant to the jobs community colleges are to achieve, the unique characteristics of the institutions, their staff members, and relationships with communities, other institutions, etc. A willingness to experiment and evaluate the results of the experimentation was strongly implied.

ORGANIZATION

Two organizational structures were proposed as potentially profitable departures from the traditional patterns. Both of these organizational structures are outgrowths of the more traditional patterns, but each attempts, in different ways, to minimize disadvantages and maximize advantages.

One additional comment might be made concerning these "non-traditional" organizational structures. It is assumed that an organization, e.g. a community college, exists to achieve certain primary objectives. In addition to these primary objectives, there are objectives of secondary importance, such as maximizing communication among units and individuals, maintaining high morale, etc. Recognizing that these secondary objectives interact with achievement of the primary objectives, they are nevertheless secondary. Therefore, if the community college must suffer some discomfort in the secondary areas, in order to achieve the primary objectives, this must be accepted as necessary and so recognized. No one is willing to say that college administration is an easy task,

nor are they willing to say that the primary task of college administration is to make college administration easier. If this were so, the appropriate course of action would be to merely hire some faculty members, let them group and organize themselves as they wish, offer whatever courses to whatever students they might choose, etc. I believe that most persons directly concerned with higher education today will agree that this pattern has long outlived its usefulness, not only in the community college.

The first of these proposed patterns is related to the bifurcated structure found in junior colleges. For example, the college would be divided into two parts, each administered by a second line administrator directly responsible to the chief campus administrator. These two administrators might be called Dean of General Studies and Dean of Occupational Studies. The third level within the organizational structure would be comprised of divisions, each administered by an appropriately titled administrator. A fourth level of structure might be departments. As far as structural considerations are concerned, the titles of these units are not important, and the number of levels required would depend primarily upon the size of the institution and the comprehensiveness of its offerings. If four levels are assumed in our exemplary organization (Chief Campus Officer, two deans, divisions, and departments) the divisions would be primarily identifiable as belonging to the general studies area (Science and Mathematics, Humanities, Social Sciences, etc.) or the occupational studies area (Electronic Technologies, Engineering Technologies, Health Sciences, etc.).

The unique element of this proposed pattern would be the absence of single line relationships between divisions and the deans. For example, the Health Sciences division would not be singularly responsible to the Dean of Occupational Studies, but would be responsible to both deans. Similarly, the Social Science

division would not be responsible to just the Dean of General Studies, but to the Dean of Occupational Studies as well. In effect, this would force the two deans to operate as a team and would avoid the "segregation" that is likely to occur in the completely bifurcated structure.

Such structures would have obvious advantages and disadvantages. Equality is implied since the two second level administrators would be at the same level in the structure. It is assumed that they would be treated equally in terms of salary, authority, etc. By breaking down the singular line relationships, integration would be promoted. For example, if the Engineering Technology division felt that it required a particular type of Mathematics course for one of its programs, the division administrator and appropriate faculty members could go directly to the Dean of General Studies and the division and/or department responsible for Mathematics instruction. The difficulties of staff members having responsibilities in both areas would be alleviated. An example might be Mathematics instructors who would have teaching loads consisting of regular college algebra and special Mathematics courses required by technical programs. This proposed structure seemingly violates one of the "laws" of administration: that any one person should have one and only one superior to whom he is responsible. This is a tradition to be questioned. Such traditions should not be followed simply because they are traditions, but the choice should be determined by the effectiveness with which the desired outcomes are achieved. It is recognized, however, that in order to avoid potential personnel difficulties, the functions for which deans and divisional administrators are responsible would require a high degree of specificity. For example, to again use the area of Mathematics as an illustration, the functions of the Occupational Studies Dean, division administrator, and individual faculty members, as they pertain to technical

programs, would have to be clearly defined and delineated from the functions that the division administrator and faculty members might have in common with the General Studies Dean, as defined and delineated in the field of Mathematics. In effect, each division administrator would have only one boss for one particular function.

A second pattern of organization departs entirely from the general versus occupational, transfer versus terminal, liberal arts versus technical, etc., type of organization. In this proposed organization, the divisions would not be identifiable as either general or occupational. Their titles would probably reflect the traditional units found in institutions of higher education, such as Social Science, Physical Science, Life Science, Humanities, Mathematics and/or Engineering, etc. These divisions would be responsible to only one administrator, perhaps a Dean of Instruction, or in smaller institutions the President himself. Their exact composition, as indicated with the other proposed organizations, would depend upon the size and comprehensiveness of the institution. Size would primarily determine the extent to which they would be divided into departments. This organizational pattern departs from the usual structure with one top level instructional administrator in that there are not separate divisions and/or departments of technical or occupational composition. Instead, the faculty members in these areas would be "integrated" in appropriate divisions. For example, faculty members in the Health Technology areas would logically belong to the Life Sciences division. Programs, courses and faculty members in the Electronics areas would logically belong in the Physical Sciences division.

Several advantages are obvious. The likeihood of "segregation" and unequal treatment of programs and faculty are greatly decreased. Greater integration is implied. For example, in the traditional type of organization it is quite easy

for a Physical Sciences division administrator to disregard the courses and faculty members in Electronics Technology. He can rightly say that the welfare of the faculty members are not his responsibility and that the quality in the courses does not reflect upon the integrity of his domain. Both of these arguments cease to exist when the Electronics Technology courses and faculty members are placed under his direct jurisdiction. He cannot ignore the quality of the courses and instruction.

Since the divisional, and perhaps even departmental units, are much smaller and faculty and administration within these units are likely to know each other much more personally, it becomes difficult for the administrator to not have some regard for all the faculty members in his area. This structure almost guarantees greater communication among staff members, especially as these communications pertain to task areas.

Any inequality would almost have to be at a personal level with this type of structure. In effect, the "separateness" of technical programs would cease to exist, to a large degree. This type of structure obviously places responsibility at a lower level and creates greater demands and responsibilities at lower levels in the organization. Likewise, this requires greater skill at definition, delegation and supervision at the upper levels of the organization.

Research has shown that faculty members, particularly in the academic areas, tend to have equal or greater allegiance to their disciplinary areas than their institutional allegiances. Informal communications and organizations also tend to follow these disciplinary channels, due to the more obvious visibility of common interests and concerns. This proposed structure should permit "academics" and "occupationalists" to share and develop broader common concerns. The initial establishment of such a pattern will undoubtedly, however, be accompanied by a

certain amount of discomfort, tension, misunderstanding, etc., since people would be placed in close contact with "different" types of persons than they have been used to associating with.

RESEARCH

The many research implications growing out of the discussion thus far are by now apparent to any skeptics in the audience. In fact, many of the reactions and recommendations quite explicitly require research activities of various sorts. In addition to these, a number of "single shot" topics are proposed.

Many of these proposals, especially those related to the previously identified problem areas, are of a basic nature, as opposed to applied or institutional research, and due to their interrelationships could best be placed within the framework of a more comprehensive design rather than being tackled separately. The most obvious of these comprehensive projects relates to the problems of organization and structure. It is not proposed that "the best" organizational structure be found, but that the criteria by which any individual institution might select "its best" structure, taking into consideration its own objectives, limitations, community environment, etc. This research might consist of the following coordinated sub-projects. The sub-projects imply a chronological ordering but many of the projects could proceed simultaneously and certain phases of the projects would by necessity have to overlap if a coordinated and tightly structured research design is to result.

The objectives of college programs, must be more specifically defined. Ways must be developed by which the achievement of these objectives can be measured. This project should not only be concerned with the definition and measurement of relevant areas of student achievement, job performance, etc., but should be concerned also with large scale institutional measures. For example, in terms of

the student population which the college serves, to what extent is human capital increased? This requires an examination of a problem which has long plagued Economists but to which they have recently addressed themselves with much interest. What are the economic returns to differing educational investments? In institutional terms this would involve a determination of the relative value to be placed on successful students in different programs as well as drop-outs, academic failures that cannot be "persuaded" to take appropriate programs, etc.

Research efforts should be directed toward the identification and classification of various organizational structures existing in colleges. The common and unique features of various organizations should be made evident. These should include persent organizations as well as currently proposed and yet to be developed experimental organizations. These studies should involve formal and informal structures, communications, extra-college determinants, multi-campus structures, as well as single campus institutions, inter-institutional relations, state systems, etc. The extent to which organizational characteristics and the characteristics of individuals interact should be more accurately assessed. Techniques such as those used by Blocker and associates at the University of Texas, and Davis (James A. Davis, et al. "A Technique for Analyzing the Effects of Group Composition." American Sociological Review, 26: 215-26. April 1961.) seem especially promising. Such studies would of necessity deal with the entire institution and thus are related to a variety of topics. The community and larger social units must also be included.

Given more accurate assessment of the achievement of educational programs, and more empirical examination of organizational structures, additional studies should be undertaken to see how these two areas are related. The effects of various patterns and characteristics of an institution upon its students and

constituents should be assessed. This study would of necessity involve an intensive examination of college-community interaction, liaison and communications between the college and other institutions, analysis and prediction and projection of educational needs, etc. This area of study is obviously related to techniques and studies in other areas such as public relations, advertising, sales management, media research, motivational research, etc. It is exceedingly frustrating when the manufacturer of dog food can predict with some accuracy the results of actions he might take whereas a community college can develop a technical program in an area of supposedly obvious need and have difficulty in obtaining students.

One of the more important research areas pertains to faculty attitudes. This can be considered a separate area of study but obviously is related to the previously mentioned sub-project concerned with administrative structure and organization. The nature of this research area can perhaps be best described, briefly, in terms of specific questions. How and when are faculty attitudes formed? Are there steps which might be taken in the education and selection of faculty members which might result in more positive attitudes? What things can be done to change faculty attitudes after they are employed especially in comprehensive community colleges? This proposed research area does not imply that the identification and classification of attitudes as positive or negative is to be taken for granted. For example, it is not the role of the administration to define what is to be regarded as positive or negative. Rather, the processes which result in the formation and change of attitudes toward characteristics of comprehensive community junior colleges by those operating in such institutions is the primary concern.

These research "proposals" are, of course, far from specific. Much additional work would need to undertaken before researchable questions could be developed. In fact, much of the needed "research" work appears to be concerned

with the identification of techniques which might take these problem areas more researchable. It is interesting to observe that several of the Research and Development Centers are concerned with different parts of this problem area. It is hoped that some coordination and extension of these parts might be possible.

Since inter-institutional relations were implied in the title of this session, I should make some reference to this. In the interests of time I will simply hypothesize the extension of the organizational principles inherent in the intra-college structures to multi-campus and inter-institutional levels, perhaps in state systems of higher education. We can return to this in the discussion period if interest warrants it.

LIST OF TABLES

All tables give figures for New York State as a whole, except for Tables 2, 26 and 27 which include figures for the 10 major labor market areas. Data for new claimants and beneficiaries are based on a 10 per cent sample of new claimants in the periods designated.

Table

1. Nonagricultural employment, registered unemployment and new claimants, 1953-1963 8
2. Nonagricultural employment and registered unemployment, all industries and manufacturing by major labor market area annual average, 1961-1963 9
3. Age of new claimants who received benefits and of the civilian labor force, by sex 10
4. Occupation of new claimants who received benefits and of employed private wage and salary workers, by sex 11
5. Industry attachment of new claimants who received benefits and of workers in employment covered by unemployment insurance, 1962 12
6. Per cent women among new claimants who received benefits and among employed workers in manufacturing industries, 1962 12
7. Beneficiaries by sex, age, industry and occupation, benefit years ending in 1963 and 1962 13
8. Beneficiaries by industry and occupation, benefit years ending in 1963 14
9. Age in relation to industry and occupation of beneficiaries benefit years ending in 1963 15
10. Median age of men and women beneficiaries and proportion of women among beneficiaries, by industry and occupation, benefit years ending in 1963 16
11. Beneficiaries by number of weeks of benefits received, sex, age, industry and occupation, benefit years ending in 1963 17
12. Average benefit duration for men and women beneficiaries, and per cent who had maximum duration, by age, industry and occupation, benefit years ending in 1963 18
13. Benefit exhaustions by sex, age, industry and occupation, benefit years ending in 1954-1963 . . 19
14. Beneficiaries by number of spells of unemployment and sex, benefit years ending in 1963 20
15. Number of spells of unemployment in relation to average benefit duration, by sex, benefit years ending in 1963 20
16. Number of spells of unemployment in relation to exhaustion of benefit rights, by sex, benefit years ending in 1963 20
17. Number of spells of unemployment in relation to age, industry and occupation of beneficiaries, benefit years ending in 1963 21
18. Beneficiaries by weekly benefit rate and sex, benefit years ending in 1963 22
19. Average full-week benefit payment and per cent of beneficiaries at maximum weekly benefit rate of $50 by sex and age benefit years ending in 1963 22

20. Average full-week benefit payment and per cent of beneficiaries at maximum weekly benefit rate of $50 by sex, industry and occupation, benefit years ending in 1963 23
21. Beneficiaries by base-year weeks of work and earnings in covered employment and by sex, benefit years ending in 1963 and 1962 24
22. Per cent of men and women beneficiaries who worked fewer than 27 weeks or earned less than $2,000 in base-year covered employment benefit years ending in 1963 25
23. Per cent of men and women beneficiaries who had 50 to 52 weeks of work and earnings of $5,148 or more in base-year covered employment benefit years ending in 1963 26
24. Weeks of covered employment in base-year in relation to base-year earnings of beneficiaries, benefit years ending in 1963 27
25. Average benefit duration in relation to weeks of work and earnings in base-year covered employment, benefit years ending in 1963 27
26. Beneficiaries in New York Metropolitan area by sex, age, industry, occupation and benefit experience, benefit years ending in 1963 28
27. Beneficiaries in upstate labor market areas by sex, age, industry, occupation and benefit experience, benefit years ending in 1963 29
28. Benefit status and benefit denial experience of claimants, by sex, benefit years ending in 1963 30
29. Reasons for disqualification among all disqualified persons, by sex, benefit years ending in 1963 31
30. Reasons for disqualification of claimants at original claim filing or during benefit year, by sex, benefit years ending in 1963 32
31. Sex, age, industry and occupation of disqualified beneficiaries by reason for disqualification, benefit years ending in 1963 33
32. Disqualification rates, by sex, age, industry and occupation, benefit years ending in 1963 34
33. Benefit duration of all beneficiaries, nondisqualified beneficiaries and disqualified beneficiaries by sex and reason for disqualification, benefit years ending in 1963 35

UNEMPLOYMENT INSURANCE CLAIMANTS, 1962-63

During 1962, more than one million unemployed workers filed new claims for unemployment insurance benefits in New York State. Their entitlement to benefits was based primarily on work performed in the 52-week "base-period" preceding the date on which they filed a new claim. Their benefit year, if they were entitled to benefits, was the 52-week period following the filing of the new claim.

Persons who received benefit payments drew them for periods of unemployment in 1962 or 1963 or in both years, but all had benefit years ending in 1963. In this report they are called, for brevity, "1963 beneficiaries" or simply "beneficiaries."

This report describes the personal characteristics of the workers who filed new claims for benefits in 1962, their past work experience, and their benefit record.

Employment Background
(See Tables 1 and 2)

The year 1962 was one of recovery from the 1960-1961 recession. The rise in economic activity that began in March 1961 continued into 1962. Employment rose almost steadily from its seasonal low in January 1962 to its seasonal high point in September but dipped in the last quarter of the year. Nevertheless, throughout 1962 nonfarm employment in every month except December was higher than in the corresponding month of any previous year. Nonfarm wage and salary employment averaged 6,259,900 in 1962, about 103,000 above 1961.

Employment maintained its high level in 1963. Except for January and April, employment was the same or a little higher each month than a year earlier and averaged 6,272,500 for 1963 as a whole. Among the industry divisions, however, only service, government, and trade registered increases over a year earlier. All other industry divisions showed no growth or a small reduction in average employment between 1962 and 1963.

Manufacturing had a larger work force, on the average, in 1962 than in 1961, although the fourth-quarter level dropped. Biggest increases over the year were in electrical machinery, autos and trucks, primary metals, stone, clay and glass products and nonelectrical machinery. Employment in nondurable goods manufacturing averaged approximately the same in 1962 as in 1961.

Most major nonmanufacturing industry divisions reported employment gains between 1961 and 1962. Service industries showed the greatest employment growth, particularly in health, education and miscellaneous business services. Most of the increase in government employment was at the State and local government levels. Wholesale and retail trade employment expanded to new highs. In retail trade, large increases were recorded for eating and drinking places, and general merchandise and food stores. Employment in contract construction showed a substantial increase. Most of the rise in finance, insurance and real estate was in banks and other finance agencies, as it had been for several years.

The employment loss in transportation industries was due in part to a transfer of several thousand bus drivers to government payrolls.

Unemployment Developments
(See Tables 1 and 2)

Registered unemployment averaged 293,000 in 1962, 55,000 fewer than in 1961 and a five-year low.1/ In every month in 1962, except November and December, registered unemployment was below the level of the same month in the prior year. The late-year rise in registered unemployment continued into 1963, which started with more unemployment than a year earlier. By September the trend was reversed. However, the annual average of registered unemployment for 1963 was higher than in 1962.

During the course of every year, unemployment shows an irregular movement from month to month, in response to short-term seasonal and frictional influences. In January 1962, 104,000 more unem-

1/ Registration under the regular State and Federal unemployment insurance programs. Does not include 28,000 unemployed persons who were registered, on the average, in the first six months of 1962 under the Federal Temporary Extended Unemployment Compensation (TEC) Act.

ployed workers were registered for benefits than in the preceding month, the result of normal post-holiday and cold weather cutbacks. Between the seasonal high point of unemployment in January and the seasonal low in October 1962, registrations of the jobless decreased by 181,000. In 1963 the difference between the seasonal high and low points of unemployment was 240,000.

New Claimants
(See Table 1)

New unemployment also reflected both seasonal and cyclical influences. The number of persons who filed new claims for unemployment benefits in the first quarter of 1962 was at a high for the year. New unemployment decreased in the second and third quarters as seasonal manpower needs in some industries over-shadowed retrenchment in others. In the fourth quarter of 1962 job cut-backs that were perhaps more than seasonal raised unemployment above the level of the preceding quarter and also of the fourth quarter of 1961.

For 1962 as a whole, unemployed workers who filed new claims for State unemployment insurance benefits numbered 1,036,000. This was 43,000 less than the total for 1961. More than one-fifth of the new claimants in 1962 did not become beneficiaries. Of these, 40,000 filed valid original claims but drew no benefits because they shortly returned to work or for other reasons, and 193,000 persons were held not entitled to benefits.

Characteristics of Beneficiaries
(See Tables 3 - 10)

About 804,000 unemployed persons, more than three-fourths of the new claimants in 1962, drew benefits in their individual benefit years ending in 1963.

Beneficiaries differed from the State's labor force and employed population in several aspects. Beneficiaries included relatively more women than found in the working population as a whole. Production and other manual workers were a much larger segment of the unemployed than of the entire working population. Manufacturing workers—in particular, apparel workers—made up a larger share of the unemployed than of employed workers. Unemployment was also high in the construction industry, in which seasonal slowdowns and poor weather conditions made for intermittent layoffs. Although trade is also a seasonal industry, it accounted for a smaller proportion of beneficiaries than of covered employment.

The median age of unemployed workers who received benefits was about the same as that of the entire working population. Actually, teenagers and young adults had the highest unemployment rates within the total labor force, but many of these young workers are not eligible for unemployment insurance.

The number of 1963 beneficiaries was 3 per cent smaller than the number of 1962 beneficiaries. Decreases occurred in all age groups, and in most industries and occupations. Exceptions were non-durable goods industries other than apparel, finance-insurance-real estate and semi-skilled occupations in the apparel trades.

Manufacturing workers made up more than half of the beneficiaries, with apparel workers forming the largest single group. In the 1963 benefit year, one of every five beneficiaries was an apparel worker, one of every six came from trade activities, one of every eight from metals and machinery manufacturing and a similar proportion from construction.

The industrial distribution of beneficiaries has shifted over the years: manufacturing workers – in particular, apparel workers – have accounted for a smaller proportion of beneficiaries in recent years. Manufacturing workers as a whole decreased from 65 per cent of 1954 beneficiaries to 54 per cent of 1963 beneficiaries. Apparel workers made up 31 per cent of the beneficiaries in the 1954 benefit year compared with 21 per cent in the 1963 benefit year. The apparel industry work force has declined considerably in the past decade.

Most beneficiaries (67 per cent) were production and other manual workers. Semi-skilled workers were the largest single group, and unskilled and skilled workers followed in size. White-collar workers formed 19 per cent of the total and service workers, 8 per cent.

Semi-skilled workers made up 31 per cent of all beneficiaries but close to three-fourths of the beneficiaries from apparel manufacturing. Skilled workers made up 16 per cent of all beneficiaries, but accounted for 48 per cent of those from the construction industry. Clerical workers represented

11 per cent of all 1963 beneficiaries, 18 per cent of all women beneficiaries and 80 per cent of all women beneficiaries from finance-insurance-real estate.

Men made up 57 per cent of 1963 beneficiaries, about the same proportion as in the 1962 benefit year. Women beneficiaries outnumbered men, however, in various industries. These included apparel, textiles and leather manufacturing, telephone services, department and apparel stores, insurance companies, and personal health, legal and educational services. Women beneficiaries were also more numerous than men in clerical work and semiskilled apparel occupations.

The median age of 1963 beneficiaries was 41.9 years; three-fifths were between 25 and 55 years. Over the decade, young workers have risen in proportion to total beneficiaries, and older workers have declined. Those under 25 years of age accounted for 10 per cent of 1954 beneficiaries and for 15 per cent of 1963 beneficiaries. Beneficiaries over 65 years of age decreased from 7 per cent of the total in the 1954 benefit year to 6 per cent in 1963. More older workers are retiring as receipt of social security and private old-age pensions spreads.

Among 1963 beneficiaries, apparel workers were older, on the average, than those from other industries. Finance-insurance-real estate, however, contained the highest proportion of beneficiaries over 65 years, and also of beneficiaries under 25 years. In metals and machinery manufacturing, half of the beneficiaries were between 25 and 45 years of age.

Clerical workers and unskilled workers were the youngest occupational groups. Workers in service occupations excluding personal service were the oldest, on the average, among beneficiaries; three-fifths were 45 years or older. In the professional occupations, more than half the beneficiaries were between 25 and 45 years old.

The median age of women beneficiaries was higher than that of men. Relatively more women beneficiaries than men were in the middle age range whereas more men beneficiaries were under 35. The proportion of beneficiaries over 65 years was higher for men than for women.

Length and Frequency of Unemployment
(See Tables 11 - 17)

Although the total number of beneficiaries declined slightly, average duration of benefits increased somewhat in the 1963 benefit year. Beneficiaries received an average of 14.1 weeks of benefits that year compared with 13.9 weeks in the 1962 benefit year. Average length of unemployment increased in all age groups, except for those under 25 years where it stayed the same. In most industries and occupations, also, average duration increased slightly. In finance, and metals and machinery industries and in clerical and service occupations (excluding service), average duration decreased slightly. A fifth (22 per cent) of the 1963 beneficiaries drew benefits for the 26-week maximum allowed under the regular unemployment insurance program; the proportion for 1962 beneficiaries was similar. (Length of unemployment refers to the cumulative number of weeks of benefits received in a benefit year.)

Among the large industry groups, unemployment was shortest, on the average, for beneficiaries from transportation equipment, apparel and leather goods manufacturing. It was longest for those from food manufacturing, general contracting (excluding building), restaurants, hotels, amusement and recreation services, and from finance and real estate. In general, unemployment was shorter for skilled, semiskilled and unskilled workers than for other occupational groups.

Women were out of work slightly longer than men, on the whole. Older workers tended to be jobless longer than young and middle-aged workers. Half of the beneficiaries 65 years and over drew benefits for 26 weeks, the majority of them in one continuous period.

Most beneficiaries had more than one spell of unemployment. Almost two-thirds of all 1963 beneficiaries had two or more periods of unemployment; one-fifth had four or more periods. Production and other manual workers had more intermittent unemployment than white-collar workers. The apparel industry was characterized by frequent and short periods of unemployment.

Ten per cent of all beneficiaries drew 26 weeks of benefits in one continuous period. The proportion was 4 per cent in apparel manufacturing, 13 per cent in metals and machinery manufacturing, 22 per

cent in the finance group, and 26 per cent in service occupations excluding personal service. Of all persons who drew 26 weeks of benefits, almost half did so in one continuous period.

Weekly Benefit Payments
(See Tables 18 - 20)

One-third of the beneficiaries received $50 a week in benefits. More than half of the men but only 7 per cent of the women received the $50 rate. Nine per cent of the beneficiaries drew less than $25 a week; the proportion was 3 per cent among men and 17 per cent among women.

The average full-week benefit payment was $38 for all beneficiaries, $42 for men and $32 for women. Men consistently received higher average weekly benefit payments than women within the various age, industry and occupational groups. Young persons under 25 were less frequently eligible for the top rate than other age groups.

Beneficiaries in professional and skilled occupations and from construction, the transportation field and metals and machinery manufacturing qualified for the top weekly benefit rate more frequently than other beneficiaries.

Workers who drew high weekly benefit amounts had shorter unemployment, on the average, than workers who received low weekly benefits.

Base-Year Employment
(See Tables 21 - 25)

Half of the 1963 beneficiaries had both worked in at least 39 weeks and earned $2,000 or more in covered employment during the 52 weeks preceding their original claim. Disregarding earnings, a little over half of the beneficiaries had worked in at least 39 weeks and a fourth had worked in 50 or more weeks in their base year.

Full-year employment in the base period, that is, at least 50 weeks of work, more frequently occurred among men than among women, among white-collar workers, and in metal and machinery manufacturing, wholesale trade and financial fields than in other industries. The proportion of beneficiaries with 50 or more base-year weeks of work was lowest in apparel manufacturing, transportation and construction.

One-fifth of the 1963 beneficiaries had earned over $5,100 in their base year: 12 per cent had earned $6,000 or more. Men earned considerably more than women. Almost one-third of the men compared with 3 per cent of the women had earned over $5,100 in their base year.

Counting only weeks they actually worked, 32 per cent of the beneficiaries had earned over $100 a week in their base year, and 20 per cent had earned over $120 a week. Among men beneficiaries, 48 per cent had averaged over $100 a week in their base-year weeks of employment and 33 per cent had averaged over $120 a week.

Forty-four per cent of the women compared with 17 per cent of the men had earned less than $2,000 in their base year.

Low annual earnings among beneficiaries generally reflected both low weekly wages and short duration of employment during their base year. Young and elderly persons, workers from retail trade, service industries and service occupations, and unskilled workers tended to have both shorter base-year employment and lower annual earnings than other workers.

Comparison of base-year employment and benefit year unemployment indicates some repetition in the claimants' unemployment experience from one year to the next. Low-paid workers tended to be unemployed longer in their benefit year than better-paid workers. Even when their annual earnings were similar, workers with shortest base-year employment were likely to have the longest benefit-year unemployment.

Experience in Major Areas
(See Tables 2, 26 and 27)

Average annual nonfarm employment increased in eight of the ten major areas between 1961 and 1962, and in seven major areas between 1962 and 1963.[2] Binghamton showed a continuing downtrend in both periods. Elmira showed a decline in average employment between 1961 and 1962, but 1963 employment was above 1961. In New York City employment fell in 1963 but remained above 1961. In Utica the decline in employment between 1962 and 1963 brought the 1963 level below 1961.

2/ For full name and geographic coverage of labor market areas, see Technical Notes – Definitions.

51

Nassau-Suffolk was the most rapidly growing industrial area in the State and showed a large employment increase in both 1962 and 1963.

Average registered unemployment decreased in all ten major areas between 1961 and 1962. In most areas a decline from year-earlier levels began in the second half of 1961 and continued into the fourth quarter of 1962. Eight of the major areas recorded an increase in average unemployment between 1962 and 1963; in Buffalo and Elmira the downward trend in unemployment continued.

Jobless workers who filed new claims in 1962 to establish benefit years ending in 1963 were less numerous in seven major areas than in the preceding benefit year. Two areas – Binghamton and Nassau-Suffolk – showed a rise in new unemployment between 1961 and 1962.

In six of the 10 areas unemployment tended to be somewhat longer in the 1963 benefit year than in the 1962 benefit year. Average duration of unemployment among 1963 beneficiaries ranged from 10 weeks in Binghamton to 15 weeks in the Buffalo and Elmira areas. In Buffalo, 29 per cent of the beneficiaries received 26 weeks of benefits; in Nassau-Suffolk, 12 per cent.

In New York City, apparel workers formed the largest industry group, accounting for 31 per cent of total beneficiaries in the area. In Albany, Nassau-Suffolk, Syracuse and Westchester, construction workers formed the largest beneficiary group. In four upstate areas – Buffalo, Elmira, Rochester and Utica-Rome – beneficiaries from metals and machinery manufacturing were far more numerous than those from any other industry group.

Semiskilled workers were the largest occupational group among beneficiaries in most major areas. In Nassau-Suffolk, the skilled and semiskilled groups were almost equally large, and in Syracuse, skilled, semiskilled and unskilled workers were about equal in size. In Buffalo, skilled workers formed the largest occupational group. Production and other manual workers far outnumbered white-collar and service workers among beneficiaries in all areas.

Average full-week benefit payments ranged from $37 to $41 among the areas. Benefit payments were lowest, on the average, in Utica-Rome and highest in Westchester.

Claimants Who Were Denied Benefits
(See Tables 28 - 33)

Of the one million workers who filed new claims in 1962, one of every four was disqualified for benefits either at the time of his first claim or during his benefit year. The disqualified group totaled 264,000 persons as follows: 70,000 whose original claim was ruled invalid,3/ 4,000 who established a benefit year but were disqualified without receiving a benefit payment, and 190,000 beneficiaries who were disqualified during the course of their benefit year.

Of the 70,000 persons who were disqualified at the time of their original claim, almost three-fifths were denied benefits because they voluntarily quit their last job without good cause. Sixteen per cent were ruled ineligible because of unavailability.

Of the 190,000 beneficiaries who were disqualified at some time in their benefit year, more than three-fifths were denied benefits because of unavailability. One-fifth were denied benefits for failure to report as required. Many of the disqualifications for these two reasons were for part of a week only. Altogether the 190,000 beneficiaries received 260,000 disqualifications; three-fourths had one disqualification and one-fourth more than one.

Women made up two-fifths of all beneficiaries but about half of all disqualified beneficiaries. They accounted for the majority of beneficiaries disqualified for unavailability and job refusal but relatively few of those disqualified for industrial controversy.

Disqualified beneficiaries were younger than those who were not disqualified. Persons disqualified for job refusal and voluntary quit – 34 years old on the average – were younger than beneficiaries disqualified for other reasons.

About one-fourth of all beneficiaries were disqualified during the benefit year; the proportion varied somewhat by age, industry and occupation. Somewhat more of the women (28 per cent) than the men (21 per cent) were disqualified. One-third of the beneficiaries under 25 years were disqualified

3/ Excludes claimants who were not entitled because they lacked sufficient base-year employment or did not return to the local office after original claim filing.

during the course of the year compared with 20 to 25 per cent of other age groups. Thirty per cent of the beneficiaries from finance, insurance and real estate were disqualified compared with 16 per cent of those from contract construction. Only 18 per cent of the skilled workers were disqualified compared with 34 per cent of the clerical workers.

Disqualified beneficiaries received benefits for a longer period, on the average, than those who were not disqualified. Benefit duration for disqualified beneficiaries includes benefits received both before and after the period of disqualification. About the same proportion of disqualified and nondisqualified beneficiaries exhausted benefits. Those beneficiaries who were disqualified for unavailability drew benefits for the longest period and higher proportion than among other disqualified beneficiaries exhausted benefits. Those who were disqualified for voluntary quit received benefits for the shortest period.

TABLES 1-33

a/ Includes following groups not shown separately: Age unknown; Other nonmanufacturing, under Industry; Agriculture-forestry-fishing and unknown, under Occupation.

b/ Industry definitions in the 1959-1963 benefit years are not identical with those in earlier years but data are roughly comparable.

c/ Definitions of semiskilled subgroups for benefit years ending in 1958 or later are not identical with those for earlier years.

n.a. Not available.

Table 14. BENEFICIARIES BY NUMBER OF SPELLS OF UNEMPLOYMENT AND SEX
BENEFIT YEARS ENDING IN 1963

Per cent distribution

Number of spells	Both sexes	Men	Women
All beneficiaries	100	100	100
1 spell	36	39	31
Of 26 weeks (maximum)	10	11	10
Of 1 to 25 weeks	26	28	21
2 spells	28	30	25
3 spells	15	15	16
4 spells	9	7	10
5 spells or more	13	9	18

NOTE: Detail may not add to total because of rounding.

Table 15. NUMBER OF SPELLS OF UNEMPLOYMENT IN RELATION TO AVERAGE BENEFIT DURATION, BY SEX, BENEFIT YEARS ENDING IN 1963

Spells of unemployment experienced by beneficiary	Average number of weeks of benefits received by—		
	Both sexes	Men	Women
All beneficiaries	14.1	14.0	14.2
1 spell	13.6	13.2	14.2
2 spells	14.1	14.0	14.3
3 spells	14.3	14.7	13.9
4 spells	14.4	15.0	13.8
5 spells or more	14.8	15.4	14.5

Table 16. NUMBER OF SPELLS OF UNEMPLOYMENT IN RELATION TO EXHAUSTION OF BENEFIT RIGHTS, BY SEX, BENEFIT YEARS ENDING IN 1963.

Spells of unemployment experienced by beneficiary	Per cent of each group who received 26 weeks of benefits in benefit year		
	Both sexes	Men	Women
All beneficiaries	22	22	23
1 spell	29	28	32
2 spells	22	20	25
3 spells	18	19	18
4 spells	16	17	15
5 spells or more	13	14	12

Table 17. NUMBER OF SPELLS OF UNEMPLOYMENT IN RELATION TO AGE, INDUSTRY AND OCCUPATION OF BENEFICIARIES, BENEFIT YEARS ENDING IN 1963

Age, industry and occupation	Total	Per cent of each group who drew benefits for --		
		One spell of 26 weeks	One spell of 1 to 25 weeks	Two spells or more
All beneficiaries a/	100	10	26	64
AGE				
Under 25 years	100	8	35	57
25 to 34 years	100	9	30	61
35 to 44 years	100	9	26	65
45 to 54 years	100	9	22	69
55 to 64 years	100	11	18	71
65 years or over	100	29	14	57
INDUSTRY				
Manufacturing	100	9	21	70
Durable goods:				
Metals and machinery	100	13	34	53
Other	100	10	29	61
Nondurable goods:				
Apparel	100	4	12	84
Other	100	12	23	65
Contract construction	100	6	23	71
Transportation and public utilities	100	10	30	60
Trade	100	16	33	51
Wholesale	100	16	34	50
Retail	100	16	33	51
Finance, insurance, real estate	100	22	39	39
Services	100	14	30	56
OCCUPATION				
Professional and managerial	100	16	36	48
Clerical and kindred	100	17	38	45
Sales and kindred	100	18	36	46
Service:				
Personal	100	16	29	55
Other	100	26	29	45
Skilled	100	7	24	69
Semi skilled:				
Apparel manufacturing	100	3	10	87
Other industries	100	10	24	66
Unskilled	100	11	23	66

a/ Includes following groups not shown separately: Age unknown; Other nonmanufacturing, under Industry; Agriculture-forestry-fishing and unknown, under Occupation.

Table 18. BENEFICIARIES BY WEEKLY BENEFIT RATE AND SEX
BENEFIT YEARS ENDING IN 1963

Per cent distribution

Benefit rate	Both sexes	Men	Women
Total	100	100	100
$10 to 19	2	1	4
20 to 24	7	2	13
25 to 29	17	8	29
30 to 34	16	11	22
35 to 39	11	10	13
40 to 44	8	8	7
45 to 49	7	8	5
50 (maximum)	33	52	7
Average full-week payment	$37.90	$42.48	$31.89

NOTE: Detail may not add to total because of rounding.

Table 19. AVERAGE FULL-WEEK BENEFIT PAYMENT AND PER CENT OF BENEFICIARIES AT MAXIMUM WEEKLY BENEFIT RATE OF $50, BY SEX AND AGE
BENEFIT YEARS ENDING IN 1963

Age	Average payment			Per cent of each age group at maximum benefit rate of $50		
	Both sexes	Men	Women	Both sexes	Men	Women
All beneficiaries a/	$37.90	$42.48	$31.89	33	52	7
Under 25 years	33.75	36.57	29.84	13	20	3
25 to 34 years	38.45	42.43	32.13	34	49	8
35 to 44 years	38.55	44.34	32.11	38	63	8
45 to 54 years	38.47	44.58	32.54	36	63	8
55 to 64 years	39.18	44.21	32.78	37	60	8
65 years or over	37.97	41.11	29.67	36	48	7

a/ Includes group, not shown separately, in which age is unknown.

Table 20. AVERAGE FULL-WEEK BENEFIT PAYMENT AND PER CENT OF BENEFICIARIES AT MAXIMUM WEEKLY BENEFIT RATE OF $50 BY SEX, INDUSTRY AND OCCUPATION BENEFIT YEARS ENDING IN 1963

Industry and occupation	Average payment			Per cent of each group at maximum benefit rate of $50		
	Both sexes	Men	Women	Both sexes	Men	Women
All beneficiaries a/	$37.90	$42.48	$31.89	33	52	7
INDUSTRY						
Manufacturing	36.48	42.17	32.06	25	49	6
Durable goods:

Other industries	38.39	41.82	32.03	31	45	6
Unskilled	35.62	40.49	28.67	25	40	2

a/ Includes following groups not shown separately: Other nonmanufacturing, under Industry; Agriculture-forestry-fishing and unknown, under Occupation.

Table 21. BENEFICIARIES BY BASE-YEAR WEEKS OF WORK AND EARNINGS IN COVERED EMPLOYMENT AND BY SEX, BENEFIT YEARS ENDING IN 1963 AND 1962

Per cent distribution

Weeks of work and earnings in base year	1963 beneficiaries			1962 beneficiaries - Both sexes
	Both sexes	Men	Women	
WEEKS OF WORK				
Total	100	100	100	100
15 to 26 weeks a/	20	19	22	20
27 to 38 weeks	26	26	27	27
39 weeks or more	54	56	51	53
39 to 44 weeks	15	14	16	14
45 to 49 weeks	15	14	16	14
50 to 52 weeks	23	26	20	23
At least 39 weeks b/	1	1	c/	2
EARNINGS				
Total	100	100	100	100
$225 to 999 d/	6	2	10	7
$1,000 to 1,499	12	7	17	12
$1,500 to 1,999	12	8	17	12
$2,000 to 2,999	23	18	30	23
$3,000 to 3,999	16	17	15	16
$4,000 to 5,147	13	17	7	13
$5,148 or over	19	31	3	17
$5,148 to 5,999	7	11	2	6
$6,000 to 7,499	7	11	1	5
$7,500 or over	5	8	c/	4
At least $5,148 b/	1	1	c/	2

a/ Persons with 15-19 weeks of base-year employment were 2.2 per cent of 1963 beneficiaries and 2.6 per cent of 1962 beneficiaries.

b/ Specific figure was not reported.

c/ Less than 0.5 per cent.

d/ Persons with base-year earnings of $225-299 were less than 0.1 per cent of the 1963 and the 1962 beneficiaries.

NOTE: Detail may not add to total because of rounding.

Table 22. PER CENT OF MEN AND WOMEN BENEFICIARIES WHO WORKED FEWER THAN 27 WEEKS OR EARNED LESS THAN $2,000 IN BASE-YEAR COVERED EMPLOYMENT BENEFIT YEARS ENDING IN 1963

Age, industry and occupation	Per cent in each group who had –			
	15 to 26 weeks of work		Earnings under $2,000	
	Men	Women	Men	Women
All beneficiaries a/	19	22	17	44
AGE

Other industries	6	22
Unskilled	5	24

a/ Claimants disqualified at original claim date as per cent of new claimants. Excluded from computation of rate are persons whose original claims were invalid because they lacked sufficient base-year employment for entitlement or because they did not return to local office after original claim filing. This exclusion was made in order to relate disqualified claimants to claimants who were potentially subject to disqualification.

b/ Disqualified beneficiaries as per cent of all beneficiaries.

c/ Includes groups not shown separately: Age unknown; Other nonmanufacturing, under Industry; Agricultural and unknown under Occupation.

TECHNICAL NOTES

Group Studied

This report is based on a sample of approximately 10 per cent of all persons, including out-of-state residents, who filed one or more original claims for benefits under the New York State Unemployment Insurance Law during 1962. Persons living in New York State whose benefits were charged to the Fund of another State and persons who filed claims exclusively under the Federal unemployment compensation programs were excluded from the sample.

The sample consists of claimants whose social security numbers end in the range 2000-2999. The total sample population divides into three groups with respect to receipt of benefits: (1) *beneficiaries* – workers who filed a valid original claim in 1962, established a benefit year ending in 1963 and received at least one benefit payment for either a full or a partial week of unemployment; (2) *entitled nonbeneficiaries* – those who met the statutory requirements for entitlement to benefits but who received no payment because their claim duration did not extend beyond the one-week waiting period; and (3) *nonentitled claimants* – those who never received a benefit payment because they failed to meet one or more of the statutory requirements for entitlement to benefits.

Each new claimant is classified into one of the categories above according to the final status he reached with respect to a benefit year.

Benefit Provisions of U.I. Law

Major provisions applicable to new claimants in 1962 under the regular State unemployment insurance program were:

1. An individual benefit year consisting of the 52-week period following the week of filing a valid original claim.

2. An individual base year consisting of the 52-week period preceding the week of filing an original claim. Under certain conditions, entitlement to benefits is based on employment in the two-year period (104 weeks) preceding the filing of an original claim.

3. A one-week waiting period (four effective days) for each benefit year.

4. Weekly benefit amount, ranging from a minimum of $10 to a maximum of $50, based on claimant's average weekly wages in his base year.

5. Maximum duration of benefits of 26 weeks (104 effective days) in a benefit year for all entitled claimants. (Extension of benefit duration to 39 weeks was provided under a temporary Federal program; experience under this program is not included in this report.)

Major entitlement provisions are described in section, Definitions of Terms, under *Claim, valid original.*

Industrial Classification

Industry data in the reports for benefit years ending in 1959 and later are classified according to the *Standard Industrial Classification Manual* (SIC), 1957 edition, Office of Statistical Standards, U.S. Bureau of the Budget. In earlier reports, employment in manufacturing industries was classified according to the 1945 edition of the SIC and employment in nonmanufacturing industries, according to the *Industrial Classification Code,* 1942 edition, of the Social Security Administration, Federal Security Agency. The change to the new classification system affects to a limited extent historical comparison of industry data.

Grouping of Manufacturing Industries

Manufacturing is subdivided into durable goods and nondurable goods. Within these subdivisions, data for the 21 two-digit manufacturing industry groups defined in the SIC are combined into four groups in this report. Industry titles of the four groups and the SIC groups they comprise are as follows.

Durable Goods

Metals and machinery. Ordnance and accessories; primary metal industries; fabricated metal products; machinery (except electrical); elec-

trical machinery, equipment and supplies; transportation equipment; professional, scientific and controlling instruments, photographic and optical goods, watches and clocks.

Other durable goods. Lumber and wood products (except furniture); furniture and fixtures; stone, clay and glass products.

Nondurable Goods

Apparel. Apparel and other finished products made from fabrics and similar materials.

Other nondurable goods. Food and kindred products; tobacco manufactures; textile mill products; paper and allied products; printing, publishing and allied industries; chemicals and allied products; products of petroleum and coal; rubber products; leather and leather products; miscellaneous manufacturing industries.

Grouping of Nonmanufacturing Industries

Tables in this report give data for each of the major industry divisions defined in the SIC except for agriculture, forestry and fisheries, mining and government. These industry divisions and establishments not elsewhere classified are grouped under *other nonmanufacturing.*

The title of one industry division is abriged for convenience in this report: *Transportation and public utilities* is used for transportation, communication, electric, gas and sanitary services.

Occupational Classification

Occupations are classified according to the *Dictionary of Occupational Titles* (DOT), 1949, prepared by the Bureau of Employment Security, U.S. Department of Labor.

Tables in this report give data for the major occupational groups except agriculture, forestry, fishing. This occupational group is included with occupation unknown in a combined group.

Because of the large number of claimants from apparel manufacturing, semiskilled is subdivided into semiskilled-apparel manufacturing and semiskilled-other industries.

DEFINITIONS OF TERMS

Base Year or period. The 52 weeks prior to the week of filing an original claim. "Week" is defined as Monday through Sunday.

Beneficiary. An individual who filed a valid original claim, established a benefit year, and received at least one benefit payment for either a full or partial week of unemployment during his benefit year. In this report, 1963 beneficiaries are beneficiaries whose benefit years ended in 1963.

Benefit payment, average full-week. Total amount of benefits paid to all beneficiaries divided by total number of full weeks of benefits (partial weeks are converted to equivalent full weeks of four effective days each).

Benefit rate, weekly. Amount of benefits to which a claimant is entitled for a full week of unemployment (four effective days), depending on his average weekly wage during base year. Benefit rates ranged from $10 to $50 a week for claimants with benefit years ending in 1963.

Benefit year. The 52 weeks beginning with the Monday following the filing of a valid original claim. Thus, 1963 benefit years referred to in this report are 52-week periods beginning in 1962 and ending in 1963.

Benefits, average duration of. Total number of full weeks of benefits divided by number of beneficiaries (partial weeks are converted to equivalent full weeks of four effective days each). Waiting period, for which benefits are not payable, is not included.

Benefits, weeks of. Number of weeks of unemployment in a benefit year for which benefits are paid to a claimant (partial weeks are converted to equivalent full weeks of four effective days each). Maximum duration is 26 weeks.

Claim. Application for unemployment insurance benefits.

Claim, additional. As used in this report, second or subsequent claim filed during a claimant's established benefit year after his preceding claim has lapsed by the intervention of a week or more for which he was not entitled to benefits.

Claim, invalid. Claim that does not meet one or more of the conditions for a valid original claim.

Claim, new or original. Claim filed by claimant for the purpose of establishing a benefit year.

Claim, valid original. Original claim filed by a claimant who meets the following conditions: (a) is able to work and is available for work; (b) is not subject to any disqualification or suspension; (c) his previously established benefit year, if any, has expired; (d) has had at least one effective day of unemployment in the week in which he files his claim; (e) has had base-year covered employment in at least 20 weeks with average weekly earnings of $15 or, lacking that, has had base-year covered employment in at least 15 weeks with average weekly earnings of $15 *and,* in the two years (104 weeks) preceding the filing of an original claim, has had covered employment in at least 40 weeks with average weekly earnings of $15.

Claimant or claimant, new. As used in this report, a worker who filed an original claim for the purpose of establishing a benefit year.

Claimant, entitled. Claimant who filed a valid original claim and established a benefit year, during which he was qualified to receive unemployment insurance benefits.

Claimant, nonentitled. Claimant who filed one or more original claims but who failed to meet all the requirements for a valid original claim. Claimant who filed a valid original claim after filing an invalid one is not included in the count of nonentitled claimants.

Denial of benefits. Suspension or withholding of benefits to claimants for all reasons (monetary and nonmonetary), either at the time of their original claim or during their benefit year.

Disqualification. As used in this report, all formal rulings by the unemployment insurance offices that deny benefits to claimants in connection with original claims or with claims filed after the start of a benefit year, with the following exception: claims ruled invalid because of insufficient base-year employment or earnings to establish a benefit year are not included. The term "disqualification" excludes also benefit claims that lapsed automatically (i.e., without a formal ruling) because the claimant did not return to the unemployment insurance office after filing an original claim. Disqualifications of claimants are made for one or more of the following reasons: unavailability for or incapability of employment, voluntary separation from employment without good cause (including voluntary quitting because of marriage or to follow spouse to another locality), refusal of suitable employment, discharge for misconduct, loss of employment owing to industrial controversy, excess earnings or employment in week of claim or failure to report as required. A part-week disqualification refers to a claimant who has received benefits or employment for part of a week and has been denied benefits for part of the same week.

Disqualified beneficiary. Individual whose benefit payments were interrupted or terminated during his benefit year because of a disqualification. A beneficiary disqualified more than once in the benefit year is classified according to the first or principal reason for disqualification. (One table in this report, however, provides a distribution of all disqualifications by reason for disqualification.)

Disqualified claimant. Claimant who was disqualified at original claim filing or during his benefit year.

Earnings in base year. Amount earned by claimant in employment covered under the New York State Unemployment Insurance Law during the 52-week period preceding the filing of his original claim, except that weeks in which claimant earned less than $15 are generally not included in the earnings total.

Effective day. Each full day of unemployment (including Saturday and Sunday) after the third day of unemployment in a week during which claimant did not earn more than the maximum allowed ($50 for claimants with benefit years ending in 1963). "Week" is defined as Monday through Sunday. Benefits are payable for a maximum of 104 effective days in a benefit year. Each unit of four effective days is counted as a week of unemployment.

Employment, covered. Employment covered by the New York State Unemployment Insurance Law. Activities excluded from covered employment are: self-employment, employment in agriculture (with a few exceptions) and interstate railroads; also, except under voluntary election of coverage, employment in nonprofit organizations and local gov-

ernmental bodies. Coverage was extended in 1960 to firms with one employee, except that employers of domestic workers were covered only when they employed four or more such workers. (In 1966 coverage of domestic workers was extended.)

Employees of New York State and some local governmental bodies are covered by the New York State Law, but Federal employees are not (they are covered under the Federal unemployment compensation law).

Employment, nonagricultural. Estimated number of nonfarm wage and salary workers who received pay for any part of the pay period including the 12th of the month. Persons on paid sick leave, paid holiday or paid vacation are included, but those on leave without pay for the entire payroll period are excluded. Persons on the payroll of more than one establishment during the period are counted each time reported. Proprietors, self-employed persons, unpaid family workers, domestic workers and personnel of the armed forces are excluded.

Entitlement to benefits. Meeting the requirements prescribed by statute for a valid original claim.

Exhaustion of benefit rights. Receipt of maximum amount of benefits to which claimant is entitled in his benefit year under the State law. The maximum of 104 effective days is equivalent to 26 full-week payments or the same amount of money in partial-week payments.

Industry. Industrial classification assigned to a claimant, usually made in accordance with the industry of his last base-year employer. In some cases the occupational classification assigned relates to a different period of employment; consequently, anomalies may arise in cross-tabulation of industrial and occupational classifications. (See also *Industrial classification*, page 36.)

Labor market area. Geographic area in which there is a major concentration of employment and economic activity. The ten major areas in New York State, which contain about 85 per cent of claimants in the State, were defined as follows:

Albany-Schenectady-Troy. Albany, Rensselaer, Saratoga and Schenectady counties.
Binghamton-Endicott-Johnson City. Broome County. 1/
Buffalo. Erie and Niagara counties.
Elmira. Chemung County
Nassau-Suffolk. Nassau and Suffolk counties.
New York City. Bronx, Kings, New York, Queens and Richmond counties.
Rochester. Monroe County. 1/
Syracuse. Madison, Onondaga and Oswego counties.
Utica-Rome-Herkimer-Little Falls. Herkimer and Oneida counties.
Westchester. Westchester County.

Nonbeneficiary, entitled. Claimant who met the statutory requirements for entitlement to benefits but who received no benefits because his claim duration did not extend beyond the one-week waiting period.

Nonbeneficiary, nonentitled. Same as *Claimant, nonentitled.*

Occupation. Occupational classification assigned to claimant, usually based on his recent work experience or usual work activity, education and training. In some cases the industrial classification assigned relates to a different period of employment, consequently, anomalies may arise in cross tabulation of occupational and industrial classifications. (See also *Occupational classification*, page 37.

Registered unemployment. Number of persons in New York State applying for benefits in mid-week of the month under the New York unemployment insurance program and the Federally financed programs covering civilian employees of the Federal government and ex-servicemen.

Unemployment, duration of or length of. As used in this report, same as *Benefits, weeks of.*

Unemployment, partial. A week (Monday through Sunday) during which claimant had from one to three effective days of unemployment.

Unemployment, spell of. Single continuous period of unemployment during which a beneficiary received benefit payments. (Number of spells shown in this report is an overstatement because it is based on a count of original and additional claims, which do not always represent the start of a new spell of unemployment.)

Unemployment, week of. Four effective days of unemployment.

1/ Area coverage was extended, effective January 1965.

Waiting period. Period of four effective days of unemployment at beginning of each benefit year for which entitled claimant receives no benefits. The days do not have to be within a single week, but must be accumulated before any effective day is credited for benefit payment.

Week, partial. Same as *Unemployment, partial.*

Weeks of work in base year. Weeks in which claimant worked in employment covered under the New York State Unemployment Insurance Law during the 52-week period preceding the filing of his original claim. Any week (Monday through Sunday) in which claimant was employed in at least one day is counted as a "week of work," except that weeks in which claimant earned less than $15 are usually not included.

*EMPLOYMENT PROJECTIONS; *INDUSTRY; *EMPLOYMENT TRENDS; EMPLOYMENT PATTERNS; *STATE SURVEYS
ARKANSAS

Two methods and three data sources were used to project employment in Arkansas for the year 1980. Data were taken from census reports, Arkansas Employment Security Division publications, and National Planning Association projections for the United States and Arkansas. First, the historical trend technique was used to project total agricultural and non-agricultural employment, and to determine projected employment in individual non-agricultural industries. This group of projections assumed a rate of employment growth below that expected for the nation as a whole for the period. The second method involved measuring and projecting individual industry and total employment growth rates under the assumption that the Arkansas growth rates would approximate those expected for the nation as a whole through 1980. Presented separately according to the method used, the tabular data show, for both 1960 and 1980, several aspects of employment: (1) employment by industry and percent distribution, showing Arkansas as a percent of the United States,, (2) employment diversification, (3) diversification of manufacturing employment, and (4) employment by major industry group by region. 3-A.10	Employment by Major Industry Groups, Arkansas, by Region, 1960 and Projected (Series II) 1980	21

Methodology

Two methods were utilized to project employment in Arkansas to 1980. First the historical trend technique (Series I) was used and modified where appropriate, to project both agricultural and non-agricultural employment, and to determine projected employment in individual non-agricultural industries. The total of these individual projections was then compared to the total non-agricultural employment projection, and where necessary, adjustment was made in the individual industry projections especially in the manufacturing sector. This group of projections assumes a rate of growth that is somewhat below that expected for the United States as a whole for this period.

The second procedure involved measuring and projecting the growth rate of an industry in Arkansas relative to that projected for the same industry at the national level (Series II). Here again, individual non-agricultural industries were treated separately, and thereafter aggregated and compared to the projected total for all non-agricultural employment, the objective being to derive from the two sets of data a single projection. This second set of projections represents growth of total employment in Arkansas at a rate that approximates that expected for the nation through 1980.

Similar methods were used to project employment in each region, except that non-agricultural employment was not disaggregated, and agricultural employment was given special allocative treatment based on historical decline in number of small farms, changes in cotton technology, and other pertinent influences. In addition, the regional employment projections for manufacturing employment,

non-agricultural non-manufacturing employment, and agricultural employment based upon the individual growth rates among the separate regions were reconciled to be consistent with the state totals.

It is not possible to make statements of probability regarding both the Series I and Series II projections except to say that they are likely levels of employment if the underlying assumptions continue to be valid. Periodic study of the actual future situation as compared with that which is assumed will be necessary if planning activities based upon these projections are to remain realistic.

Data Sources

The data for providing an annual historical picture for the state by industry sector employment and for the regions by manufacturing and non-agricultural non-manufacturing are those published by the Arkansas Employment Security Division. The Census of Population data provided more detailed information on employment within the regions and information for relating state employment figures to certain demographic characteristics of the population. Data from both of these sources were analyzed and related to the National Planning Association projections for the United States and Arkansas.

Assumptions

In constructing the industry projections several basic assumptions were made:

1. It was assumed that there would be no significant natural calamities;

2. The present major social institutions would continue to be the dominant behavioral influences;

3. There would be no major war; and

4. No major economic depression would occur.

In addition to the basic assumptions, it was assumed that certain state trends would continue into the future and that certain trends would change in the future.

The state trends that are expected to continue are as follows:

1. Movement toward the United States distribution of employment by industry, age group, and sex;

2. Existing types of manufacturing industries will continue expanding or locating in Arkansas;

3. Advances in cotton production technology will continue to be incorporated and extended at approximately the same rate as in the recent past; and

4. Total personal income will increase in the future at about the same rate as in the last several years.

The state trends that are expected to change are as follows:

1. Some Arkansas manufacturing industries which enjoy a real cost or locational advantage will increase more rapidly than is true for the nation as a whole;

2. State labor force participation rates by color and sex will rise toward the 1960 United States average;

3. The occupational mix of Arkansas will change. There will be relatively more skilled workers than at present, but Arkansas will continue to lag behind the pattern of the occupational mix for the nation.

4. Out-migration will diminish substantially from that which took place during the 1950-1960 decade;

5. The rate of decline in the number of small farms will lessen over the twenty-year span; and

6. Unemployment will decline reaching a level of approximately 5 percent by 1980.

Presentation of Projections. Employment growth in Arkansas was presented in the written and tabular material of Sections 3 and 7 of this report. Between 1940 and 1960 there were large agricultural employment decreases, substantial non-agricultural employment increases, and in some industries, very rapid employment increases.

Tables 3-A.1 and 3-A.2 show that these trends in employment are likely to continue into the future, although the rate of change is expected to decline from 1960 to 1980. The lower projected employment (Series I) for 1980 is 736,800, and the higher projected employment (Series II) for 1980 is 811,900. As was mentioned earlier, the lower employment figures represent a somewhat less than proportional growth for the state compared to that expected for the nation through 1980; the higher figure represents an expectation of employment growth that will keep Arkansas's proportion of national employment nearly the same in 1980 as it was in 1960.

Tables 3-A.3 through 3-A.8 show the Arkansas employment pattern becoming more specialized in manufacturing, and less

specialized in agriculture. Manufacturing shows increased diversification, but with the exception of the electrical machinery industry, the state's manufacturing will likely be dominated by those industries that have historically been the principal employers.

Series I and II employment projections for the regions of the state are presented in Tables 3-A.9 and 3-A.10, and show the expected employment for major industry groups and the change in relative importance of these industry groups among these regions.

*CURRICULUM PLANNING; *EDUCATIONAL CHANGE; PILOT PROJECTS; *SCHOOL SYSTEMS; *ROLE PERCEPTION; ORGANIZATIONAL CHANGE; *DECISION MAKING; SYSTEMS ANALYSIS

This paper reviews literature for administration theory, social system theory, antecedent variables, perception of decision making roles, criterion variables, planned and implemented curricular change, and ancillary variables as they relate to pilot studies involved with decision making, curriculum productivity and quality, and personnel participation in curriculum planning, and reports a study based on this review. A "Decision Point Analysis Instrument" was devised and administered to 6,138 persons in 31 Wisconsin school systems. It contained 25 items designed to determine perceptions concerning the decisions made by 10 position holders in each system. Measures of productivity, quality, and participation were also made in these systems. Some sample results were: (1) School systems differ widely in their productivity, participation, and quality of curricular planning, (2) Productivity and quality were not significantly related to participation, (3) A positive correlation was found between the amount of change in curricular plans and the extent of use and implementation by teachers, (4) Curricular changes involving content deletion were seldom found, and (5) Curriculum planning was positively related to curriculum productivity. A response to this paper, by Arthur McBeath, is included. (EM)

Administration and the Educational Program*

James M. Lipham
Department of Educational Administration
UNIVERSITY OF WISCONSIN

What is the nature of the relationship between the adminstration of the schools and the educational program of the schools? Oversimplified answers to this rhetorical question range from "philosophical" to "operational" and from "extensive" to "occasional." Among those who view administration as a process, some maintain that the primary contribution of the administrator to the program of the schools is assisting in the process of goal setting; others feel that the process of evaluating classroom behavior represents the ultimate criterion of leadership. Among those who view administration as a series of tasks, some maintain that the educational program is, or should be, a functional area of primary concern to administrators; others are quick to point out that finance, plant, and community relations activities often occupy as much as 90 percent of the administrator's time--with the educational program receiving very little attention.

To avoid tautological answers and to explore the complex interrelationship of administration to the instructional program, a series of long-range studies recently was initiated in the Department of Educational

Administration at the University of Wisconsin.[1] These studies were conducted with regard to a particular theoretical point of view; they were concerned with three major variables--decision-making roles, planned curricular change, and implemented curricular change--and they included several intermediate, ancilary variables. Let us examine, however briefly, each of the aforementioned concepts before turning to some pilot findings and implications for action.

A Point of View

In general, administration has been conceptualized from two approaches, the sociological point of view and the psychological point of view. Gouldner[2] referred to these two approaches in terms of the rational model and the natural system model. In the rational model, the organization is viewed much like a machine with manipulatable parts which the administration may modify to increase the efficiency of the whole--virtually "organization against people." Exponents of this view follow essentially Weberian principles

[1]Glen G. Eye and James M. Lipham, "Relationship Between Instructional Change and the Extent to which School Administrators and Teachers Agree on the Location of Responsibilities for Administrative Decisions," United States Office of Education Project 1913 Proposal, (Madison: Department of Educational Administration, December 1963). Individual studies related to this project include the following dissertations completed in the Department of Educational Administration at the University of Wisconsin: Donald C. Francke, "Perceptual Accuracy and Personal Variables;" Kenneth H. Reinke, "Authority Structure and Decision Making in School Systems;" Bryce M. Fogarty, "Characteristics of Superintendents of Schools and Centralization-Decentralization of Decision Making;" Eugene W. Tornow, "A Study of the Relationship of Teachers, Perception of Decision Points and the Interactions of the Superintendent of Schools, The Director of Instruction, and the High School Principal;" Emmett J. Duffy, "The Role of Director of Instruction--Tasks, Interactions, and Processes."

[2]Alvin W. Gouldner, "Organizational Analysis," Sociology Today: Problems and Prospects, Merton, Bloom, and Cottrell, Eds. (New York: Basic Books, 1959).

of bureaucracy, of which some of the most salient characteristics are: (1) behavior within the organization is bound by normative or technical rules, (2) labor is divided into a high degree of specialization, (3) offices are organized following the principles of hierarchy, and (4) administrative acts and decisions are codified into written rules.[3] Recently, Selznick[4] and Merton[5] developed models of this approach, based in part upon Weberian principles, in order to describe modern organizational phenomena.

The second view of administration, the natural system model, is one in which the organization is perceived as being spontaneously maintained by individuals who have needs of their own which must be satisfied regardless of the plans of the creators or maintainers of the organization. The natural system model was expounded most effectively by Mayo[6], Roethlisberger[7], Lewin[8], and more recently, Argyris[9]. This view can best be represented as

holding that individuals are the most significant component of an organization and that although formal organization exists, it does so at the pleasure of individuals singly or collectively in the informal organization. The aim of the informal organization is to achieve the goals of the individuals rather than the goals of the organization--virtually "people against organization."

As many have recognized, somewhere between these divergent views lie more productive means for analyzing administration and its relationship to the educational program. One of these, social system theory, attempts to synthesize these divergent views. It was in terms of this theory that the research reported herein was conducted.

Parsons[10] and his colleagues proposed a basic theory of human action which delineates the primary components of social system theory. Adapting this theory into a functional model of administration as a social process, Getzels and others[11] defined a social system as two or more people interacting to achieve common goals. The social system involves both normative and personalistic dimensions which are conceptually independent and phenomenally interactive. One dimension, the normative, is described by values within the culture and roles within the organization; the other dimension, the personal, is described by the values within the individual and the

Thelen, "The Classroom Group as a Unique Social System," Dynamics of Instructional Groups, N.S.S.E. Yearbook, Part II (Chicago: The Society, 1960), pp. 53-82.

need-dispositions within the individual. The elements comprising the two dimensions interact within the framework of the social system to produce observed behavior.

According to this theory, administration may be examined from three stances. Structurally, administration may be considered as a hierarchy of superordinate-subordinate relationships within the social system. Functionally, within this hierarchy of relationships is the locus for allocating and integrating roles in order to achieve the goals of the system. Operationally, administrative processes take place in enviornments characterized by person-to-person relationships. Thus, any given superordinate-subordinate relationship within the administrative structure is enacted in two dynamic and separate personal situations, one embedded in the other. This relationship is perceived and organized by each incumbent in terms of his needs and goals, skills and experiences. The two situations are related to the extent that the individuals' perceptions are mutual.

The central question, and primary antecedent variable thus becomes, "To what extent do complementary role incumbents in a given social system tend to agree or disagree in their mutual perceptions of their respective roles?"

Roles within an organization may, of course, be defined in numerous ways--the tasks one performs, the processes one utilizes, or the products of one's services. They also may be defined in terms of the decision one makes.

The Perception of Decision-Making Roles

For years authorities have argued cogently that decision making is the very heart of administration. Originally discussed by Barnard,[12] decision making was expanded by Simon,[13] who wrote, "The task of deciding pervades the entire administrative organization quite as much as does the task of doing--indeed, it is integrally tied up with the latter." McCamy[14] made the same point when he stated, "The making of decisions is at the very center of the process of administration." Griffiths[15] recently applied Bross'[16] design for decision making to the educational organization, defining decisions as judgments which effect a course of action.

Decision making was, therefore, selected as a focus for study, not because of any heuristic value of the concept itself, but because of several utilitarian factors. First, decision making may involve numerous complementary role incumbents, since it is possible to share in the process of decision making--and to share with varying degrees of frequency and intensity. Second, decision making occurs within all formal organizations--albeit at differing levels of centralization or decentralization. Third, decision making may be perceived or inferred by parties to an interaction.

[15] Daniel E. Griffiths, Administrative Theory (New York: Appleton-Century-Crofts, 1949).

[16] Irwin D. J. Bross, Design for Decision (New York: MacMillan Company, 1953).

And, finally, decision making bridges conceptually the rational (normative) systems model and the natural (personal) systems model. It is compatible in this regard with the theoretical framework used, social system theory.

Operationally, the central question and primary antecedent variable then becomes, "To what extent is there congruence in the perceptions of the decision-making responsibilities of personnel within public school systems?" or, put differently, "To what extent do administrators and teachers in a given school system tend to agree or disagree in their perceptions of decision-making roles and responsibilities?"

Numerous investigations of decision-making roles recently have been conducted, but these studies usually end at the point of highlighting the nature and extent of conflict in role expectations or perceptions. While such studies are of value, there was found a crucial need for determining the extent to which conflict in decision-making roles relates to the educational program defined in terms of such significant criterion variables as planned curricular change and implemented curricular change.

The Educational Program

The educational program is typically defined as the curriculum of the school. Since the term curriculum came into use in the nineteenth century in France, a variety of meanings has been attached. According to Ragen[17], curriculum traditionally has meant the subjects taught in school--the course of study. Eye and Netzer[18] stated that the most common definition of

curriculum is that it constitutes all of the educative experiences that come under the direction and control of the school. Shane and McSwain suggested that curriculum consists of two separate, but related entities:

> First, in written form as a record of group consensus as to methods, materials, scope and sequence; and second, under the skin of the teacher and child as the sum of experiences and guides-to-action that each has interpreted for himself as the outcomes of their interactions in school.[19]

Since it is the written curricular plans to which most people refer when speaking of the educational program, however, the following salient questions may be raised: "To what extent do curricular plans represent planned instructional change?" and "To what extent are these plans implemented?"

Planned Instructional Change

Instructional change has received considerable attention, though not to the point of examining and quantifying the extent of change contained in curricular plans. Curricular workers have indicated an awareness of the need to know more about the intricacies of curricular change.

The impetus for examining change in curriculum may be traced to a general emphasis placed on educational change. Barrington expressed as follows the reason for the importance of change to education:

> Education needs to comply with the law of dynamic survival not only because of change in our social order, but because of newer insights into the learning process, the conditioners of behavior, the tools of teaching, and the powers of education in the lives of people . . . These new insights have led to new educational practices or inventions which are designed to take the place of outdated practices.

> Only by being aware of changing social needs and by being willing to break with tradition and discard outmoded practices can education meet the challenge which it faces today.[20]

In 1951, Ross summarized in part the attention devoted to change throughout the 1930's and 1940's in studies by Mort and his associates. Under the term "adaptability" these educators examined the systematic readiness and capacity of schools to adopt innovations, adapt to environmental changes, and continue functioning.[21] Representative of these studies was that conducted by Mort and Cornell in which they concluded that diffusion of innovation is a slow process. " . . . We infer it will take a half century for the average adaptation to diffuse completely."[22]

Recently, there has been a renewed emphasis upon educational change and innovation. As Pellegrin commented, curricular change is a topic of interest both to the practitioner and to the theoretician.

> Within the field of education there are also many pressures for change. There is widespread recognition among educators that there are notable deficiencies and limitations in the content, organization, and administration of the curriculum. At the same time, there has arisen a higher level of aspiration, a feeling that education can increase its contributions to the welfare of society. There is, in short, a belief that changes in education are necessary and desirable . . .[23]

As typically defined, change simply conveys the meaning of alteration, or modification. In the field of education, however, change is most often used in a positive sense: the meaning absorbs the concept of betterment and improvement. Illustrative of this usage is the proposition developed about the supervision of instruction by Eye and Netzer who stated, "The major function of supervision is that of influencing situations, persons, and relationships for the purpose of stimulating change that may be evaluated as improvement."[24]

The social sicences generally have contributed much toward the understanding of change. Doll recognized this when he stated the following:

> Whatever social scientists and educators have learned about the process of change in individuals and groups may generally be applied to the process of improving persons and institutions. With reference to improvement of the curriculum, the educator must, of course, make further applications of the findings of social psychology, sociology and other social sciences to his own field.[25]

Lippitt, Watson, and Westley[26] commented that change processes in organizations may be classified as spontaneous, developmental within the system, fortuitous, unplanned changes outside the system, or planned change. Planned change they defined as that which originates in a decision to make a deliberate effort to improve the system. Also, a social scientist, Bennis[27], categorized planned change as one of eight types of change in a paradigm of

change processes. He described planned change as entailing mutual goal setting by one or both parties of the change relationship--the parties having equal amounts of power and deliberativeness or intentionality.

The stages by which planned change occurs also have received the attention of social scientists. According to Loomis,[28] change occurs in three stages. Included in initiation, the first stage, are ideas and decisions regarding the nature, direction, and extent of change. Sentiment pertaining to the change is communicated in the second stage, legitimization. The third stage involves achieving congruence of those systems of values which are held by the persons seeking to create change and those affected by the proposed change. Lewin, too, viewed the process of change to consist of three stages. He stated, "A successful change includes, therefore, three aspects: unfreezing (if necessary) the present level, moving to the new level, and freezing group life on the new level."[29] Considering change as innovation, Rogers[30] conceptualized five steps in the change process: awareness, interest, evaluation, trial, and adoption.

In the field of education, curricular plans may be regarded as expressions of planned change. Mackenzie described curricular change as the outcome of the interaction of participants, power, and process, as follows: "Participants in curricular change, having control of certain sources of power and methods of influence, proceed through various phases in a process

to influence the determiners of the curriculum."[31]

The literature of the field of curriculum does not contain instances of attempts to measure either planned change or extent of change in curricular plans. Curricular change is nominally reported as an isolated event with little reference either to past or concomitant change. However, change in curriculum has been viewed in relation to other factors which provide some perspective for examining extent of planned change in the curriculum. Benne and Muntyan[32] considered such factors when they observed that curricular change has been approached in three basic ways: change the objectives of the curricular program, change the content, and change the teaching method. Miel[33] wrote that the changes involved when school curriculum is truly modified are actually changes in attitudes and behaviors of persons.

Although there appears to be an increasing awareness on the part of curricular theorists and practitioners of the importance of planned change, there exist speculative intervals in the literature regarding the extent of change contained in curricular plans. And what of the implementation of these plans?

Implemented Instructional Change

Educators probably engage much more in the planning of instructional change than in the implementing of instructional change--at least if the quantity of research and writing in the field is indicative. Only a handful of investigators has been concerned with the implementation of change.

Godbey[34], evaluating curricular development in Michigan, observed that poor communication was a deterrent to adequate reporting of the results of curriculum study and implementing programs resulting from the curriculum study. Heusner[35] investigated the use of curricular guides in relation to teacher participation in their development, and concluded that utilization of curricular guides by teachers did not necessarily result from those teachers having participated in the planning of the guides. He concluded that conditions must be present relative to such factors as recognition of need for curricular change, time adequacy, and role and organization. Milstein[36] sought to determine the extent and direction of changes in classroom practices of teachers which might be expected from their having participated in the production of curriculum guides. In his study, only negligible change was observed, the exception being in the use of materials in language arts and arithmetic.

Krug implied use of curricular plans when he stressed that curricular planning and development is composed of five groups of activities:

(1) Teaching and learning
(2) Identifying and stating purposes of schooling
(3) Developing the all-school program
(4) Providing curriculum guides
(5) Providing instructional aids for teachers and learners.[37]

Representative also of work in curricular improvement is that of Alberty and Alberty who arranged the activities of curricular improvement into the following steps:

(1) Creating a feeling of need for improving the curriculum
(2) Determining a comprehensive organizational structure for curriculum improvement
(3) Formulating or reexamining the basic philosophy and goals of the school
(4) Developing working principles for dealing with adolescent development and learning
(5) Determining the general design of the curriculum
(6) Determing the scope and sequence of the curriculum
(7) Developing principles and procedures for planning and guiding learning
(8) Discovering and organizing resource materials for instruction
(9) Setting up a comprehensive evaluation program.[38]

Again, it appears that the assumption is made that teachers will be using the improved curricular program, which will then be evaluated.

In the area of curricular evaluation, Taba inferred the use of curricular plans when she wrote:

---

[38] Harold B. Alberty and Elsie J. Alberty, Reorganizing the High School Curriculum (New York: MacMillan Company, 1962), p. 502.

> A special weakness of current evaluation programs is the fact that data about the progress of students toward educational objectives are evaluated or interpreted without sufficient knowledge of the nature of the instructional program.[39]

The cyclical nature of the evaluation process, with the accompanying assumption that curricular plans are implemented, is demonstrated in the following comment by Saylor and Alexander:

> Evaluation and planning are really complementary processes. We plan the curriculum to achieve educational values. Our planning is based on evaluation of existing plans in terms of their relevance to these values, and our subsequent evaluation determines the relevance of new plans to whatever values are held, and then we plan further. We plan on the basis of evaluation and we evaluate the basis of planning; evaluation without planning or planning without evaluation is incomplete and hence unwise.[40]

In summary, the conclusion may be reached that, as an area of investigation, the implementation of curricular change represents a potentially fruitful, largely unmapped domain.

Ancilary Variables

In addition to the dual criterion variables, planned and implemented curricular change, several intermediate, ancilary variables must also be taken into account when examining the relationship of administration to the educational program. These include both organizational and personal factors. Organizational factors presumed to influence the relationship of administration to the instructional program include extent of administrative centralization-decentralization, interaction patterns among the

administrative and supervisory staff, school district size, and school district wealth. Personal factors presumed relevant include leadership characteristics, personality orientations, and biographical characteristics, such as age, sex, training, and experience, of school personnel.

Having discussed the nature of the supporting theory, social system theory; the antecedent variable, the perception of decision making roles; the criterion variables, planned and implemented curricular change; and having enumerated several intermediate, ancilary variables, we may now turn to some of the pilot findings.

Some Pilot Findings

To assess the extent of congruence among teachers' supervisors', and administrators' perceptions of the locus of decision making responsibilities, a Decision Point Analysis instrument was devised and administered to 6,138 respondents representing the total professional staff members in thirty-one Wisconsin public school systems. The Decision Point Analysis instrument consisted of twenty-five items, related to and divided equally among the functional areas of pupil personnel, staff personnel, curriculum, business management, and school-community relations. It also contained the titles of the ten following positions common to each of the school systems in the sample: business manager, principal, vice-principal, department head, special subject supervisor, superintendent, director of instruction, guidance coordinator, board of education, and teacher. For each decision item respondents provided answers to the following three questions: (1) "Who makes this decision?", (2) "What other persons participate in making this decision?", (3) "What is the nature of your participation in making this

decision?". It was therefore possible to conduct a simultaneous analysis of ten major organizational roles.

Results from this instrument were indeed revealing. To cite only some examples of the major findings, we discovered that:

(1) School systems differed significantly in the extent to which administrators and teachers agreed on the locus of decision making responsibilities. In some school districts there was, in fact, little agreement on who made which decisions. This was particularly the case with regard to curricular decisions: it was somewhat less so with regard to financial decisions.

(2) In some districts, administrators, by comparison with teachers, tend to underestimate (and, in other districts, to overestimate) the frequency and extent of their own involvement in decision making. For example, in one district the administrator felt that he shared widely with others the responsibility for making curricular decisions, yet the teaching staff perceived that he made most, if not all, such decisions.

(3) Teachers often stated that they did not know who made which decisions. In some districts, the teacher's knowledge of decision making roles and responsibilities was limited.

(4) Teachers in some districts felt that they were minimally involved in the decision making process. On many decision items they simply responded "no involvement," on others they simple "provided information only"--a minimal level of involvement.

(5) Contrary to what one might expect, size of district was not significantly related to agreement on the locus of the responsibility

for decision making. There was as likely to be agreement on perceptions of decision making roles in large school districts as in small ones.

(6) Several personal and biographical variables, such as leadership characteristics: needs for achievement, dominance, and conjunctivity; years of experience; recency of training; and sex of respondent were significantly related to agreement on perceptions of decision making roles. That is, the possibility exists that one might identify in terms of a stereotypic, personalistic syndrome those who tend to misperceive decision making roles.

To extend further our knowledge ragarding the perception of decision making roles, efforts are presently being made to manipulate experimentally perceptions of decision making roles, to assess the extent of change resulting from such manipulation, and to determine the subsequent impact of such change on curricular planning and curricular implementation.

To ascertain evidence of planned instructional change, all curricular plans produced in the five high and the five low congruence school systems during the last three years were collected and evaluated. A <u>productivity</u> index for each school system was calculated in terms of the number of curricular plans (documents) produced. A <u>participation</u> index for each school system was calculated in terms of both the number of staff and the hours spent, individually and collectively, in the production of curricular plans. A <u>quality</u> index for each school system was computed by content analysis and evaluation of each curricular document.

To assess the degree of implemented instructional change, data were elicited through structured individual interviews with teachers in each of

the five high and the five low congruence school systems. Within each school system an eighteen percent sample of teachers was selected randomly for interviewing. Each teacher was interviewed concerning only one curricular plan related to his subject matter area or instructional grade level. The interviews were structured by the use of a Curricular Implementation Index interviewer guide and scoring sheet. Each interviewee was asked three questions concerning twelve instructional decisions: (1) "How much do you use this plan for . . .?", (2) "How much of a change is this from what you were doing before?" and (3) "What kind of change is this, addition, subtraction, or rearrangement?" Responses were summarized to obtain a picture of the degree of curricular implementation.

Regarding the assessment of the educational program, again it is possible to mention here only some sample results. It was found that:

(1) School systems ranged widely in their productivity, participation and quality of curricular planning. In some districts, little had been produced, that which had been produced was of low quality and represented little or no change over previous curricular documents.

(2) Productivity and quality were not significantly related to participation in curricular planning. That is, neither the number of people involved nor the number of hours spent working on a plan made any appreciable difference in quantity of output or quality of output.

(3) A positive correlation was found between the amount of change in curricular plans and the extent to which teachers implemented the plans, using them in making instructional decisions.

(4) Curricular changes which might be characterized by the deletion of material seldom were found, compared with those characterized by the addition of material or the rearrangement of material. Comparatively speaking, teachers seldom were unable to recall eliminating anything from the curriculum.

(5) The quality of curriculum planning was significantly related to productivity in curriculum planning. That is, some school systems not only produced more, but the more they produced, the higher the quality.

(6) Quality of curricular planning was found to be significantly related to congruence in perceptions of responsibility for making the "decision on the appointment of teachers to curriculum committees" as well as the "decision on the adequacy of teacher performance." Both productivity and quality of curricular planning were found to be significantly related to congruence in perceptions of responsibility for making the "decision on the selection of textbooks."

Some Implications

Let us now draw briefly some practical implications. On the basis of the findings, as well as personal experience, it appears that we would do well to:

(1) Discuss frankly and openly mutual perceptions of expectations for complementary roles within the school. Administrator-administrator, administrator-teacher, and teacher-teacher perceptions should be raised from the implicit level to the explicit level, since consensus in perceptions, particularly regarding certain curricular decision, appears to be systematically related to quality

and productivity of curricular planning.

(2) Provide teachers-in-training, particularly in undergraduate programs, with a clearer understanding of the complexity of administrative decision making within the educational organization. In this regard, it also is likely that many of our local orientation and in-service programs should at least be re-examined, if not restructured entirely.

(3) Alter our present mechanisms for involving teachers. Since many teachers did not feel involved in making major decisions, it may well be that many of our present teachers' committees are concerned only with making minor decisions.

(4) Quit blaming dysfunctional operation on such largely irrelevant factors as size of the bureaucracy. Large school districts can, and do, operate as smoothly as small ones.

(5) Attempt to increase the "organizational awareness" of submissive, retiring, inexperienced, females of limited training, since they more often misperceive decision making responsibilities within the organization.

(6) Save the ditto paper that is used in many local districts to produce ill-conceived, poor quality curricular documents. It might be just as well, if not better, to seal the curriculum from the next district than to be forever starting from scratch. That is, it is the quality of the curricular plan, rather than participation in its development, which determines whether or not teachers will use it.

(7) Analyze the precise nature of changes in the curriculum with respect to taking some things out, rather tha continually adding or

rearranging concepts, materials, and activities. In fact, "What can be thrown out?" might be a fruitful initial stance to take in many curricular planning sessions.

(8) Pay closer attention to the selection of textbooks, the appointment of teachers to curricular committees, and the evaluation of teacher performance, since it is these decisions which bear significant, positive relationships either to curricular productivity or curricular quality, or both. For example, some people take issue with the use of a text when they might better profit from taking issue only with the use of a poor text.

(9) Change our curricular plans more often if we wish the plans to be implemented. Otherwise, many teachers will update what they are doing and make changes anyway--even random changes--leaving the old plans on the shelf gathering dust. Under such circumstances, the school has, in effect, no over-all curricular plan but as many idiosyncratic individual plans as there are teachers on the staff.

(10) Listen to what the students, by their feed-back behaviors, are attempting to tell us. Just as the administrator misperceives teachers, thinking that he is sharing widely responsibilities for decision making, so do teachers misperceive students, thinking that students actually are learning when, in fact, they are only being taught.

COMMENTS ON PROFESSOR LIPHAM'S
ADMINISTRATION AND THE EDUCATIONAL PROGRAM"

Arthur McBeath
University of Illinois

Introduction

Professor Lipham presents a report of studies at the University of Wisconsin on some aspects of the "complex interrelationship of administration to the instructional program" and the framework within which these studies were conducted. In studying this kind of topic, and similarly in commenting on such studies, one faces a dilemma. Should we take the molecular approach wherein we may study the real substance of the topic or shall we take the molar approach wherein we may be able to look at the entire picture with all the variables included plus the interrelationships and also the cross-situational and cross-cultural effects. In the first case our view may be so microscopic as to be practically lost when one who is working in the organization tries to perceive the image. In the second case, although new terminology and models initially appear interesting, the study has a tendency to be so superficial that often it is practically worthless as far as extending our knowledge or understanding. Professor Lipham's solution to the dilemma is to study at the molecular level but to set it in a framework at the molar level. Guba, though, suggests that with the general level of sophistication so low in change research, it is more beneficial to stick to the molar approach.[1] One then has to raise the questions, "How molecular is the study?" or "How basic are the elements?" and also "How suitable is the theoretical framework?" Part of my purpose in this paper is to address myself to these questions.

Variables

Professor Lipham has limited his report to the relationships among conflict in perception of the decision-making roles, planned curricular change, and implemented curricular change. One might ask why these particular relationships received the emphasis of the Wisconsin studies? From an "organization" or "administrative" viewpoint it is easy to see that decision making is an important variable and

Professor Lipham has substantiated this. From a teacher's viewpoint in looking at change in educational program, I think the decision making would be considered important also. But it must be kept in mind that the report of these studies is limited to perceptions of roles in decision making and I assume that this restriction is used because research has often shown that it is not the actual decision making that is important but how different persons perceive the act that appears to be crucial. These studies, though, have been even more restricted to the consensus or lack of consensus of this perception. Thus, when we restrict a study to amount of consensus we have a group variable.

The criterion variable of planned curricular change in the form of an official document is really an organizational or administrative factor and is less defensible as a crucial program variable in my estimation. Implemented curricular change, as measured in this study, seem to be more valuable as a crucial program variable. One should note that the kernel of the criterion variables is "change" and thus the emphasis is on the relationship of consensus to "change" although change is restricted to two narrow limitations of educational program.

The criterion for good change is here defined as planned change as recorded in an official document. This again seems to be an administrative criterion for the best kind of program change or it may have been the only objective measure that could be obtained. From a program viewpoint I think it might be more defensible to use change in course goals or objectives whether formally documented or not as an example of a better criterion variable. Also, it seems to me that degree of difference in about three areas might be a valuable criterion of change in program.

I look on planned change as what we have to put up with if teachers are not planning. Planned change as it is most often used is external to the operation and imposed. It is abrupt and irregular. Planning is obviously necessary in educational programs and unless teachers constantly involve themselves, they will find changes planned for them. Thus, I would not choose planned change as defined by a curriculum document for my criterion variable.

The area of investigation is extended by the inclusion of some situational variables such as organizational factors and by the inclusion of some personal variables. These are considered as intermediate variables to the major equation of consensus of perception and program change.

Results

In commenting on the results reported by Professor Lipham, I have included only those results which I found of interest or those results which stood out from my point of view.

I think it should be restated that they describe the picture as it was at the time of the study. Sometimes conclusions or implications are made which infer that these are the results you would always expect or that these are the results you should expect. For instance a different kind of study might look at what happens to decision making about educational program following a self-assessment seminar for teachers and administrators. What happens in the decision-making process if one changes the kind of control within the organization from that of an administrator who is primarily concerned with maintaining the organizational structure to a leader who is primarily concerned with initiating a new structure or procedure to accomplish the organization's goals? This view which distinguishes between administration and leadership is described by Professor Lipham in another recent publication.[2] Answers to these kinds of questions would add further to our understanding of decision making regarding educational program.

Since Professor Lipham has provided us only with some examples of the results, my comments would need to be clarified further, but they will serve the purpose of raising questions.

The results (p. 17) do not seem to indicate any pattern on the perception of decision-making roles within the State of Wisconsin. This emphasizes the importance of getting hold of the situational factors both within the organization

and outside the organization. Both administrators and teachers varied widely and the consensus varied widely. Pettigrew had stated that the importance of the situation has been demonstrated in a wide variety of settings.[3] He is discussing the much stronger area of racial interaction and thus, the implications are widespread. Many individuals seem fully capable of immediate behavior change as situations change. There are a few persons (apparently the extremes of authoritarianism at both ends) who are consistent no matter what the situation, but the majority of people shift their attitudes and therefore their perceptions as the situation changes.

The reported results seem to indicate some personal patterns related to consensus. Thus, there appears to be a need for an interactional approach where we study the consensus of certain personal types in defined situations. I wonder what the picture would have been had the perception of decision-making roles been related to "organizational climate" or types of organization?

The results in this section seem to indicate a great variation in the consensus of perception of who makes the program decision, a lack of communication within the institutions, and the universal attitude of teachers that they are minimally involved in the decision-making process. To each of these one asks, "Why?" The interesting fact that size was not a factor in the extent of the relationship should emphasize that bureaucratization can occur in any organization.

When the program variables were related to extent of consensus, the results have been polarized into those with high consensus and those with low consensus (pp. 19 & 20).

The results that participation, as defined by the number of hours spent working on a plan or the number of people involved, did not affect the quality or quantity of output is not too surprising considering the confusing results which have been found in industrial psychology.

Vroom (1964) discusses many studies in which increased involvement of the employees in decision making was related to increased production.[4] French and his associates studied the workers in a garment factory who were involved in a large-scale industrial change. Participation was extensive and consisted of a series of eighty meetings and changes were made as a result of employee suggestions. The results showed that a year later there was increased productivity and decreased turnover.[5] Vroom carried out a study which suggests that there are individual differences in the effects of participation in decision making on performance. The amount of participation was related to performance for all persons, but the size of the correlations varied systematically with needs for independence and authoritarianism. Vroom concludes this section by stating:

> It seems important for future research to proceed beyond the demonstration that 'participation works' to determine the conditions under which it "works most" and "works least." The usefulness of participation . . . can be greatly enhanced by further knowledge concerning the conditions under which the effects of participation on decision quality, group norms, and ego involvement are maximized and minimized.[7]

Hoffman (1965) found that the important ingredient of participation is influence. The more influence one had on the decision the more likely he was to implement the decision. Pseudo-participative procedures such as letting a person take part in a decision which was already made were ineffective in improving satisfaction and amount of participation in discussion seemed unimportant for acceptance of the group decision.[8]

In other words "participation" is a complex phenomenon and any conclusion based on a restricted definition of participation which does not fully explore the situational patterns should be considered very tentative.

Implications

The implications (pp. 20, 21, & 22) discussed at the conclusion of the paper are important for people involved in program development. Most are quite

obvious results of what Professor Lipham has told us. Number 10 seems to be an intuitive leap to an area of student behavior for which there is no evidence in the information we have.

I have already made reference to the entire question of participation and thus, I would consider the latter part of number 6 to be far too strong.

The implications (number 1 & 3) which refer to making roles more explicit and altering the mechanism for involving teachers are of prime importance. The difficulty is that no direction is given as to the respective roles of administrators and teachers in planning curriculum change. To conclude that the only important element is consensus is fraught with all kinds of dangers. Since the original equation was restricted to consensus, it is obvious that other relationships would not be found in these studies.

Framework

Finally, and as an extension of the report on the Wisconsin studies we should consider some aspects of the frame of reference.

Implied in role theory is the belief that certain kinds of behavior are expected of incumbents of certain position but not of others. Pellegrin has provided some evidence that the teacher participates almost exclusively in activities pertaining to her classroom and he concludes:

> For one thing, the teacher is constrained by the environment-both formal and informal-in which she works. This is generally true of other positions and their incumbents. Second, existing role expectations both encourage and impede change, but in the main they mitigate against the teacher's serving as a source of innovation. Third, it is quite evident that there is a lack of institutionalized procedures through which the teacher can play an important role in the innovative process. Given the existing situation it is unrealistic to expect basic changes to occur as a result of innovativeness by teachers.[9]

Since Lipham has shown a lack of consensus of perception of decision-making roles and since Pelligrin has indicated that in reality the role the teacher is expected to fulfill is quite narrow, it behooves us to look carefully at some possible

reasons for this. One consideration that is often neglected is the professional role of the teacher. Thus, it is quite possible for teachers to take part in some stage of many curriculum changes through the institution of the professional organization and through influence of the norms of professionalization which might be quite separate from participation through the formal organization of the institution of the school. For example collective bargaining is one form of institutionalized procedure for involving teachers in change.

The point is that participation in certain kinds of change within the institution of the school or the school system is firstly not expected and secondly may not indicate actual participation.

The other aspect is the entire question of kinds of program decisions. A number of educators have indicated that there are at least three or four program levels. The first is the instructional or classroom level and it is reasonable to expect more decisions regarding content and method which will emphasize adaptation to individual students at this level. Secondly, there is an institutional level in which the program decisions can be related to the area needs such as vocational emphasis. Then there is a State and National level. Some of the very complex questions concerning the nature of the discipline will be determined at these levels. Participation by teachers from any one school is not likely to be related to factors of quality or quantity in the State or National aspects of programs.

The point then is that there is a good possibility that the elements of program are likely to vary greatly according to the level at which they are mainly determined. Thus, the intensive study of program change needs to differentiate among levels when considering the effect of participation.

Conclusion

Professor Lipham and his colleagues at the University of Wisconsin have studied in more depth than previously the area of involvement in program development and it is to be hoped that this area continues to receive intensive study.

*CURRICULUM EVALUATION; *RESEARCH PROBLEMS; *MODERN MATHEMATICS; *EVALUATION NEEDS; *EDUCATIONAL STRATEGIES

The four major aspects of the project's research and development effort are: (1) course design and textbook production, (2) evaluation and psychological research, (3) teacher education, and (4) the operation of an experimental mathematics program in secondary schools. Evaluation techniques involving classical research techniques or programed instruction have not been suitable for developing an optimum method or an optimum curriculum. Problems relative to formative evaluation stemmed from observer preparation and feedback interpretation of classroom data. Problems relative to summative evaluation stemmed from lack of contemporary test instruments, lack of control in instructional conditions, sampling techniques, and the format of raw data. These problems led to a shift in evaluation efforts from the experimental design to methodological and procedural studies and an attempt to contribute to a discipline of curriculum evaluation. A response to this paper by R.E. Spencer is included. (EM)

I. A Brief History of UICSM

Organized in 1951 as the first of the project-type curriculum improvement efforts, the University of Illinois Committee on School Mathematics has engaged in research and development in four major aspects of mathematics education. Course design and textbook production, evaluation and psychological research, teacher education, and the operation of a mathematics program in an experimental school have been integrated parts of the work of the project almost from its inception. As the project has grown to its present size [an academic staff of 37 with supporting nonacademic personnel] under the leadership of its director, Max Beberman, these four aspects have come to have somewhat separate identity.

Course design and textbook production From the beginning of the project, mathematicians, teachers, and educators collaborated in the experimentation which led to course design and in the writing and editing processes which led to text production. Dozens of high schools around the country participated in the trial of new materials. UICSM staff members visited all of these schools at least annually, and a few "pilot schools" were visited almost monthly for detailed feedback. Primarily supported by the Carnegie Corporation of New York, this work has resulted in the publication of a college preparatory mathematics series (eleven units) designed for use in grades nine through twelve. D. C. Heath and Company, the publisher and distributor of the eleven units, is now in the process of replacing the eleven units with four hard-bound textbooks. The ninth- and tenth-grade volumes are now available for classroom use.

Since 1962, with the support of the National Science Foundation, course development has been centered in two areas of the secondary school curriculum. For seventh- and eighth-grade underachievers in mathematics, who typically would never get to study regular high school mathematics, the project is preparing materials designed to rescue as many as possible of this group for further mathematical study. Headed by Professors Braunfeld and Sanders, a group of writers and teachers is working with underachieving classes in Champaign-Urbana public schools in the development of these materials. Special supplementary materials are being prepared to accommodate individual and class differences in background knowledge and in ability. Visual aids of many kinds are being devised to make mathematical concepts more graphic.

The seventh-grade course — developing operations with rational numbers — has now progressed to the field trial stage, and teachers of selected classes in Boston, Newton (Massachusetts), New York, Philadelphia, Memphis, Springfield (Illinois), Los Angeles, and Honolulu are now using them. In 1966-67 these same classes will try out the eighth-grade materials, which treat geometry intuitively in terms of transformations. Staff members visit these schools regularly, and teachers make detailed written reports on their successes and failures with the materials. After field trials and evaluation are completed, the materials will be revised again before release for publication.

Another team, led by Professor Vaughan, is developing a new tenth- and eleventh-grade course which treats three-dimensional geometry and trigonometry from the point of view of a vector algebra. This course, which is the first of its kind to be tried in this country, is primarily intended for college-bound students. It integrates geometry and algebra, thereby making each subject more useful for further study of mathematics. In addition, it provides a concrete introduction to

linear algebra, a subject of rapidly growing importance. This course is now being taught in five schools, including University High School where the authors observe pupil reactions directly. We turn now to consideration of evaluation in the formative process.

II. Strategies for Optimization of Mathematics Instruction

Most curriculum projects have been more concerned to have an impact on the total perception of a given field in the curriculum than with finding an optimum path through a discipline — a path which could be traveled by the largest number of students to appropriate vantage points from which they can make their own way (a) in collegiate study of mathematics as a major or minor or (b) in coping confidently with mathematical matters as they arise in everyday affairs or in courses outside those a mathematics major would take. Every student may be expected to continue to show an interest in mathematics; in short, to be mathematically literate — as one who keeps up with the world affairs through newspapers and magazines is politically literate. (Borrowed from Karplus' term "scientific literacy.") Although usually not included in the concept of literacy, problem-solving ability in math is also a general objective.

Beberman has exhibited a concern, from the beginning of the project, for devising materials that were best for students. This concern is reflected in the many revisions (see revision charts) and the years of personal classroom teaching that went into getting textbooks ready for hard covers. It is also reflected in the attention that Beberman paid to the voices of criticism raised against new mathematics programs. However, there are several problems of evaluation a concern for optimization raises. First, developing an optimum

curriculum or developing an optimum method of instruction for a given group of students do not lend themselves to satisfactory attack by the classical method of comparison of treatments (adopted from agronomy) nor by the new method of programmed instruction. The problem is closer to (but far more complex than) the problem of shaping animal behavior.

It will be objected that programmed instruction is not be compared with hand shaping of a pigeon because the human learner of complex subject matter has already acquired a language and can be guided by verbal instructions as a pigeon cannot. Since we may reasonably expect most human beings to comply with our instructions, the argument goes, the use of language can save the enormous time it would take a person to discover the subject matter even under the best possible reinforcement contingencies. This argument still presupposes that we know our objectives quite precisely and the route by which we wish to take the students to them. Although the first program we produce may fail to reach the objectives and later ones may succeed, there is no provision or guidance for the researcher in making major departures in path between successive revisions, since data are collected only on answers given to questions asked, and spontaneous or free responses are not elicited nor used for research guidance.

Many curriculum projects have followed this general strategem — though usually not by producing materials in self-instructional form — e.g., SMSG, CBA, CHEMS, BSCS, and others have not encouraged major departures from preliminary approaches to instruction. These, like programmed instruction research, have concentrated upon getting a particular presentation prepared in usable form and have not dealt seriously with the optimization

problem nor with understanding educational processes.

Exploratory Method in Curriculum and Instruction

Physicists have often used a test body of some kind to explore the gradient patterns (topography) of a force field. If a field of knowledge were structured topographically, the optimization problem would consist in finding a path to strategic points whose average slope is as low as possible but which is as short as possible — thus permitting most students to travel with least effort to the best viewpoints. The student himself would be the ideal test body for exploring the structure of such a field — much as Piaget has employed children to study the genetic relationships of conceptual structures. However, a topographic model may be much too simple for useful guidance in research on curriculum and instruction.

Anthropologists studying a strange culture often use themselves as participant-observers in a community of that culture, in order to get a closer look at social processes such as communication and decision making. In this method, as well as in the test-body method of exploratory research in physics, the effect of injecting a foreign body into the system being studied has to be taken into account. Doing so is part of the discipline of research.

The curriculum and instructional problems seem to require a participant-observer who directs the students' attention first to this and then to that matter and notes their reaction, but he must explore a field that already has one well-known logical structure and seek another psychological one. He must map a kind of psychological gradient of comprehensibility on a logical map of theory,

somewhat analogously to the physicist mapping forces on a geometric space. Is some combination of test-body and participant-observer approaches possible for problems of curriculum and instruction? Is it possible to carry out such a procedure in a disciplined manner that we could call scientific research?

Max Beberman has developed a style of curriculum research, having some similar characteristics, which a number of other workers in new curriculum projects have emulated or perhaps discovered independently. One can describe Beberman's research by saying that he brings students into contact with various portions of a field of knowledge and with various arrangements to presentations of these portions, and he interacts with the students to try to discover their interaction with the subject matter. Depending on their response, he suggests to them one way or another in the field as he searches for an optimum path to the regions of greatest vantage. In such research, he cannot afford to adopt specific objectives for individual lessons or portions thereof; to determine pupil responses, he must be constantly on the alert for unexpected moves on the part of students which rule out the anticipated avenues of approach or which open up new avenues for continued exploration.

This is not to say that practitioners of this style of research have no idea of what the high points are to which they seek to lead students. It is precisely with respect to what are the best vantage points for students that mathematics educators have disagreed, so strongly in what has been called "the math wars." (DeMott, 1962) However, this disagreement ultimately must be a matter to be settled by research. They do not appear to disagree on long-range objectives, such as problem-solving ability or enabling the student to be able to "navigate" the field of mathematics as much as possible "under his own steam." (Easley, 1965)

What determines whether a particular path segment in a mathematics lesson is easy or hard (likely to be followed or unlikely to be followed), we may wish to attribute to the conceptual ability of the student and the properties of the concepts along this path segment. Once this relationship is well described for the entire field, it becomes possible to design a near optimum path — that is, a path which as many students as possible in that student population find passable. Continued study of students moving along this path can now help to improve both the path and refine the underlying structure. Then presumably teachers can be trained to guide students along it.

As materials were developed from such explorations, schools and teachers were found who were willing to submit them to pilot trials. In the pilot schools new problems of formative evaluation occurred.

Feedback from teachers was collected and analyzed by a few highly trained persons who traveled from school to school to find out how the materials were working. The field observer often took charge of classes in order to find out how the students were progressing. Both they and the pilot school teachers wrote detailed reports which were used in the revision of materials.

Later, other schools, called participating schools, were allowed to use the materials provided their teachers sent in detailed reports on the difficulties they encountered and the remedies they found for them.

As the project grew in size and scope, attention was given to the task of preparing additional persons with skills as classroom observers and analyzers of teacher feedback reports. A variety of training techniques were explored:

(a) Observation reports written by trainees were scanned for clarity of communication and returned to their authors for revision until clarity was obtained. Finished reports were typed on keysort cards and punched for easy retrieval. Two of these cards are shown as an exhibit.

(b) An anthropologist was called in to lead a workshop with observers on observation techniques.

(c) A system of tape-recording a detailed account of exploratory lessons with supplementary photographs was developed by Hendrix and taught to other observers. (See the attached pages from a Newsletter which illustrate this technique.)

All of these methods proved so cumbersome that, in practice, as new writing projects were started, several members of the writing teams took on the responsibility of teaching experimental classes in order to obtain feedback directly. In order to obtain a record of pilot trial experience, teachers and observers were asked to report daily by making marginal notes on pages of the text. They were then collated on a single copy for reference by authors engaged in revision.

Despite extensive efforts to obtain detailed, if not a systematic, feedback it was generally found that revisions based on logical analysis or creative restructuring of materials account for more than 90 percent of the changes made in rewriting. Two members of one writing team, who were trained statisticians and specifically charged with developing test items for feedback, were convinced after six months effort that they could contribute more as observers in the classroom and participants in the rewriting and administering of test items.

Teacher: 10.05.03 pp. 101-103
Observer:
Date: Jan. 23, 1963

Part C, p. 101 seems to go very easily. Many students did not 'get' Ex. 3:

$$\text{Prove that } \tan 2x = \frac{1}{2}\left[\tan\left(x + \frac{\pi}{4}\right) + \tan\left(x - \frac{\pi}{4}\right)\right]$$

although the discussion is clear. They still hesitated to do the necessary work to make some of these things work out.

Ex. 6, p. 103 is not easy. The hint given by Jim was to observe that:

$$\cos (n + 1)x = \cos nx \cos x - \sin nx \sin x$$

In comparing this to the right hand side of the desired equality,

$$\cos (n + 1)x = 2\cos nx \cos x - \cos (n - 1)x$$

there was some hesitation. Even after expanding $\cos (n - 1)x$, the result was not clear. In any event, this probably ought to be discussed by the teacher, or written in the text.

1. Yes 2. Yes 3. Most 4. Some 5. No

Teacher: 5.05.01
Observer:
Date: October 16, 1962

Using the function $h = \{(2, 3), (9, 5)\}$ the teacher asked for the value for the function with argument 2 $[h(2) = 3]$. Then, what is $h(9)$? When he asked if relations have values, the student called on didn't know. The teacher said that some do, and when asked why, the student answered, 'Because functions are relations.'

$$C = \{(4, 3), (4, -3), (-4, -3), (-4, 3), (0, 5), (0, -5)\}$$

Teacher: If I ask for $C(4)$, what am I asking for?

Student: The value of the ordered pair whose argument is 4.

The teacher noted that the student said 'the value'. In this case $C(4) = 3$ and $C(4) = -3$ would force acceptance of $3 = -3$, thus 'value' is reserved for functions.

In considering the set $\{(4, 3), (-4, 3), (0, 5)\}$, the students decided that it was a function. Then regarding '$C(4)$', he asked: "What does it do? What is this symbol? Second component of ordered pair is what? A number or a numeral?"

MCBEE KEYSORT U. S. PAT. NO. 2,213,607 KD 5848 REV.

Vector Geometry
Meeting No. 4
308 Univ. H. S., Urbana
11 a.m., Thurs., 12 Sept. 1963
Teacher: M. Beberman
Observer: G. Hendrix

The class opens with a discussion of the homework on Part B, pages 1-5, 1-6, 1-7. The teacher is using a transparency on an overhead projector. The design is large and clear, and the device is working well. The teacher has an overlay with the design of the triangle ABC and the dot for point D marked on it. He slides the overlay on the number plane picture, keeping the line through points A and D parallel to the first component axis.

The teacher marks the original position of the triangle with crosses at points A, B, and C (crosses on the lower transparency). The new positions A′, B′, C′, are marked with dots. The segments $\overleftrightarrow{AA'}$, $\overleftrightarrow{BB}$, and $\overleftrightarrow{CC'}$ are drawn.

The teacher asks,

"What are some obvious things about those three segments?"

Someone suggests,

"Any two of them are parallel."

Someone objects to this because $\overleftrightarrow{BB'}$ looks like an extension of $\overleftrightarrow{AA'}$. After some discussion the students decide this is just because of the way the figure looks in the free-hand drawing. The teacher, however, raises the question,

"But suppose she were right? Suppose A, A′, B, and B′ were all in the same line? Would $\overleftrightarrow{AA'}$ and $\overleftrightarrow{BB'}$ still be parallel?"

This leads into a lengthy discussion of the nature of parallelism. What does 'parallel' mean for segments? They decide that merely saying the two segments have no point in common is not enough. The students soon find that they are not

quite sure what they mean by 'parallel lines' either. Lines that do not meet? What does it mean to say that one line meets another?

The discussion is concerned with what it should mean to say that two segments are parallel. It is agreed that this question is to be resolved by considering the lines to which the segments belong. Now the question is restated with a drawing on the board in which segments $\overline{AB}$ and $\overline{CD}$ belong to the same line ℓ and appear to be congruent.

The class is reminded,

"We are still worrying about whether the segments $\overline{AB}$ and $\overline{CD}$ are parallel. This question is still undecided." The teacher now writes on the board:

$$\text{line } p \cap \text{line } q = \emptyset$$

He reminds the class that someone has proposed this as a defining condition for parallel lines. Mr. Beberman now says,

"I can think of two lines which satisfy this condition but which I believe no one would want to call 'parallel'."

The concept of skew lines emerges readily and the concept is named, the name written on the chalk board. The class has decided also that they do not want to say that a line "crosses" itself. (See left half of the blackboard in the photo below.) Hence, if line p and line q are not skew lines, and if line p does not cross line q, then line p is parallel to line q.

Finally, they revise their definition of parallel lines to include the case, line p = line q. (See photo below.) Photo at 11:16 a.m.

We turn now to the problems of summative evaluation — or those arising out of consumer interests.

III. Performance Characteristics of UICSM Texts

The following remarks, made by Max Beberman in the foreward to UICSM Research Report No. 1, illustrate the basic problem of comparative evaluation studies, which were demanded, in many cases, by the pilot and participating schools.

"A primary objective which UICSM set for itself when it was organized in 1951 was to improve the learning of the skills and facts comprising the college preparatory sequence found in most high schools at that time. In trying to achieve this objective, UICSM made major changes in pedagogy and major changes in content especially with respect to logical organization. Teaching-by-discovery replaced teaching-by-telling in order to build interest and to tap the creative talents of students. We maintained very high standards of precision of language in our instructional materials. In order to achieve the understanding which intellectual integrity demands as a prerequisite to the acquisition of skills, we introduced the notion of a deductive organization of elementary algebra. Thus students derived the theorems which justified the usual manipulation rules and they became aware of the logical connections among the manipulation rules [e.g., the rules for combining like monomials and the rule for combining like radicals are logical consequences of the same principle]. Topics from the elementary theory of sets were introduced to give students insights into what made the mechanical procedures work when they solved equations and inequations

or when they solved systems of equations by graphing. Thus UICSM students had the opportunity not only to acquire the skills and knowledge expected from the "traditional" curriculum but also to learn mathematical ideas and techniques which were not provided for in school mathematics programs prior to UICSM. In addition, as we were told by cooperating teachers in experimental classes and as we observed on our visits to these classrooms, UICSM students were routinely developing insights into mathematics and attitudes toward new problems which were acquired by only the best students in the best of traditional classes and which mathematics educators have professed to be among the most significant outcomes of instruction.

"Any comprehensive evaluation program should consider both the primary skills-and-knowledge objective which is common to both our program and the traditional one, and the rather astounding secondary objectives which we appeared to accomplish almost as by-products. In the early years of our work we were able to look only at the primary objective in making comparative studies of UICSM students and students trained in the traditional curriculum. Naturally, it was not possible to make comparative studies with respect to new content, and we had neither the skill nor the time to develop objective tests for making comparative studies with respect to the development of insight and creativity in attacking new problems. What we could do and what we did was to collect data on students' achievement as measured by standardized algebra and geometry tests which were designed for the pre-1950 traditional curriculum. We do not pretend that these tests have provided us with a complete description of our students' achievement, and we recognize that the language used in many of the items on these tests was somewhat unfamiliar to our students. Nevertheless, we were willing to use the test results as a rough guide in revising our

instructional materials. The study reported below is the first we have published based on an analysis of the data collected by means of such tests.

"The results of the analysis are not as satisfactory as we might have hoped. Achievement by students in our pilot and participating schools was not uniformly high. These results are in accord with the subjective reports we have received from teachers and with very rough analyses which we carried out some years ago as the data was collected. These preliminary findings persuaded us to revise our instructional materials for our advanced units in the direction of including many review sections of miscellaneous manipulative exercises."

Another problem of comparison, the lack of control of conditions of instruction, is illustrated by the following chart, Figure 1, from the same report. Duration of instruction over a given body of materials was completely uncontrolled in the experimental classes but very tightly controlled in the traditional ones. Similarly, it was impossible to match groups on ability, class size, teacher training and experience. Statistical control of numerical and verbal ability (DAT) was employed with the results shown in Figure 2. Differences were mainly in favor of UICSM groups, but less than one standard deviation. However, distributions of uncontrolled variables were such as would further reduce the differences if adjustments were made on them. I suppose the disappointing results of that study have tended to slow down the work of getting the data reported.

In introducing UICSM Research Report No. 9, in which Comley analyzed correlations among 25 variables, I attempted to rationalize our efforts to make sense out of the accumulated data as follows:

Figure 1

Block diagram showing the groups into which the control and experimental samples were divided. The left edge of each block indicates the time at which that group began its course. The distribution of times of testing for these groups is indicated by the right hand boundaries of the blocks.

Figure 2. Adjusted Coop Algebra means for five experimental and two control groups (adjustments based on regression equation for combined sample). Mean Group SD: Exp. 9.30, Control 10.72.

"Curriculum evaluators are expected to answer different kinds of questions raised by a number of quite different groups of people. Authors of text materials want to know, "Where did we fail?" Psychologists want to know, "Is discovery doing anything for the pupils?" Philosophers want to know, "Are students being indoctrinated?" The supporting foundation wants to know, "Have the results justified the investment?" Most important and most difficult of all to satisfy are the demands of the consumers — school administrators, teachers, students, and parents — who want to know, "What's in it for us that we can't get just as well some other way?"

"So little progress has been made in meeting the consumers' demand in most curriculum projects, that the advice generally offered is, "Pick several programs that look good and try them out yourself." This procedure, appealing as it may be to those who nurture the ideal of teacher selection of text materials

and teacher design of the local curriculum, is fraught with administrative nightmares. Projects often fall back on less satisfying suggestions equivalent to the old bromide, "Ask the man who owns one." Comparative curriculum evaluation by means of achievement tests is a most hazardous business, although most of the consumers would settle for some such results, if offered them. The fairness of traditional tests as a measure of achievement in a new math program is a serious problem from a psychometric point of view, but to raise this question in a skeptical context seems like special pleading. More precise instruments are needed to do the job adequately, and the curriculum evaluator may be wisest in the long run who devotes the largest portion of his resources to the refinement of instruments so that what they do measure is well known.

"A more practical sort of stumbling block is to be found in the problem of sampling. The statistician's instinct is to suggest a random sample of the nation's classrooms stratified to ensure representativeness. However, classical design yields only the calculated risk that one takes in acting as though the observed superiority of one treatment over another is not due to an accident of sampling. What does this say to a potential consumer? Is he not entitled to look at the overlap in distributions for two treatments and inquire whether his classes, because of their various peculiarities, are not more likely to be among those for which the direction of difference is reversed than in the more populous categories which produce the major effect? The representative sample of teachers, of communities, of school budgets, and whatnot provides little to go on in making a decision about his classes, if he has reason to believe that these factors make a difference in the outcome and that his school is atypical in these regards. Stratified replication of comparisons would solve this problem if we had an economically small number of generally recognized types of schools to study.

"However, curriculum projects are now a part of the educational scene and exert an influence far beyond their meager output of experimental conclusions. Schools have participated or not, for reasons sound or unsound, and the history of their participation needs to be told. The present report, by Robert Comley, represents a continuation and intensification of the efforts of researchers at UICSM to reconstruct the increasingly distant history of this project — especially that of its students.

"The documents our "historians" have to work with resemble the raw data of the psychometrician more than the data one expects to find historians working with. However, the assumptions of the statistical models, which are implied in summarizing these data, are difficult to justify because the data were collected years ago by teachers who differ widely in psychometric training. The reader is cautioned to bear in mind that the data here represented have more often than not been extracted from dusty IBM cards found in envelopes the interpretation of whose markings requires considerable ingenuity. He should also keep in mind the image of the modern-day slave laborer, the undergraduate student hourly worker, who (perhaps because he too was a UICSM student or knows one) searches patiently through decks of cards and musty, wrinkled printouts to find evidence that might indicate whether Robert S. Brown, who took the DAT in 1958, and R. Stewart Brown, who took the COOP Geometry test in 1960, are one and the same person.

"Surrounded as they must be by other researchers disciplined to react in horror to data collected under unknown conditions, those who have assembled this report are to be commended on their perseverance and their discipline-of-a-different-sort. It may turn out that the diggings from which this report comes

will provide better clues to guide the decisions of practicing educators than are likely to come out of the next five years of formal research designed according to mathematical models.

"Some readers of this report may value the lists of pilot and participating schools who ventured to use UICSM materials without much in the way of comforting evaluation data. Others may be interested in searching out hidden meanings in the tables of correlations. Others will look over the CEEB scores and reject the rest. A few will be interested in the additional support given to Ferris' conjecture that the predictions offered by tests of academic ability have decreasing validity as students progress through a new-style curriculum. Those who wish to calculate intellectual risks with probabilistic models rather than with a historian's intuition are advised to read no further. Those who do read, however, are urged to send us their comments and advice in the interests of our further studies."

The somewhat pessimistic note of the foregoing discussion has been brightened by a few important results, one of which has not yet been reported. The bivariate distribution of UICSM class means on COOP algebra and DAT-Numerical is as shown in the graph attached. The distribution clearly indicates outstanding success by a fair number of teachers of moderate ability classes. This result has led us to search for teacher variables that would account for the very wide variations in results with children of comparable ability.

"Many studies of general teacher variables have been carried out, and in a few cases, such variables have been shown relevant to pupil accommplishment

Approximate relationship of UICSM achievement-ability class means with that of standard ninth grade classes.

in the new curricula.* However, most measures of classroom behavior, personality, and training of teachers seem, a priori, to have little relevance for use in evaluation of new curricula. This does not deny the value of further studies with general teacher variables, but it does suggest that some approaches to content oriented teacher variables should be developed."

That was from the foreword of a preliminary study of teacher held objectives by Ikeda using as a measure, teacher judgment of the relevance of types of test items to evaluation of their own students. Ikeda summarized his factor analysis of data from 105 teachers as follows:

"For teacher ratings, the first principal factor was related to the general tendency of each teacher's ratings, i.e., the teacher's general response set. Items asking for understanding of the basic mathematical concepts tended to have high coefficients on this factor. The second principal factor was related, in part, to a preference for conventional vs. new mathematics items. The third factor was related to objectives somewhat irrelevant to the text. The fourth factor was related to the objective of algebraic manipulation, and the fifth was left unidentified."

Pupil achievement on these items by students of six teachers did not yield factors congruent with the teacher rating factors. Kraatz is now attempting to discover a relation between teacher ratings and achievement of their pupils.

IV. Psychological Characteristics of Preferred Methods of Instruction

Very early in its history, the UICSM Mathematics Project became identified with the phrase "discovery method of teaching." According to Beberman, his intention was only to give every pupil the courtesy of allowing him to think a question through until he was satisfied. His colleagues, however, recognized in his style of teaching an unusual degree of artistry. This led some of them to seek a label for his style and to attempt to formulate rules for his instructional method.

Hendrix published two articles on discovery teaching, and rules of instruction were formulated under the label of UICSM discovery teaching. Ausubel challenged the discovery notion as a mystique (1961). My own interest was stimulated in an attempt to formulate such rules precisely enough to permit interpretation in psychological terms. I later modified this concern to the more realistic one of simply understanding psychological phenomena associated with teaching in the Beberman style, whether the original principles could be interpreted or not.

I began a series of experimental studies, in which I was joined by Avner who eventually continued alone until he was forced to leave for military duty. The first question we attacked was the alleged motivational effect of making a discovery. The emotional excitement of a discovery was supposed by some to whet a student's appetite for more discoveries.

Following a clue from a study by Blatt (1961), we attempted to find a correlation between heart rate increases and moments of discovery. We made use of the PLATO computer-based system for inducing mathematical discoveries and recording physiological data. The results were disappointing. Although sudden increases in heart rate occurred frequently — they were not consistently associated with moments of discovery as indicated by the successful answering of a problem that had been earlier attempted unsuccessfully. We also found that discoveries were quickly forgotten when we tried a retention test 20-30 minutes later.

Meanwhile, Wolfe, Brown, and Gilpin had worked with several portions of the UICSM materials in the form of programmed booklets. Their efforts, as well as those of Avner and myself, made it clear that we had captured, in a sequence of problems for the student, a means of inducing a generalization on the part of the student. Yet it was also clear that something quite different happened when such sequences were employed in Beberman's classroom or in those of teachers he had personally trained.

The sequences of problems were examined for structure. Were there rules for optimum sequencing? Sequences are too numerous to investigate experimentally, but this work did open the way to explore another rubric, the prohibition against verbalization of the rule before the discovery was made. After behavior was well established and linguistic skills were available that permitted precise formulation, UICSM texts did present rules to the students. However, efforts on the part of students or teachers to formulate rules earlier than that

were often frowned upon. Wolfe (1962) tried putting rules in his programmed materials preceding the discovery exercises designed to lead to their discovery. This made no difference in pupil achievement, suggesting that the exercises carried the burden of the instruction.

Avner tried to find a negative effect of verbalization on transfer that Hendrix had reported, but without success.

Our researches into instructional method came to an end — primarily because one sponsoring agency felt that we were getting too far afield from the main business of curriculum evaluation.

V. Follow-up Studies

The information most in demand, it seems, is usually the most difficult to obtain. The project understandably gets more requests for information about performance of former UICSM students in college than any other matter. Fear of adversely affecting college admissions has often interfered seriously with the adoption of innovations, and principals want facts with which to reassure parents who are queazy about letting their children enroll in UICSM mathematics classes. We have, therefore, released all the information we could get on former UICSM students. But follow-up information of any kind is very difficult to interpret.

We were able to contact, for example, 400 1962 high school graduates who had 3 or 4 years of UICSM mathematics and were enrolled in college. They were enrolled in 160 colleges and universities in 36 states and the District of Columbia. Eleven hundred forty-one 1963 graduates were distributed among 38 states, the District of Columbia, Belgium and Canada in 316 institutions of higher learning. Of this latter group 454 had three or fewer classmates in their institution who had studied UICSM. One wonders what grade point averages mean from such a collection of students. Nevertheless, we collected grades and averaged them. For example, Comley found that 30% of the 1962 graduates took calculus as their first math course and averaged 3.7 on a scale with C = 3. Thirty-three percent took no math in their freshman year and the rest took lower level math courses — and made slightly higher grades in them. This result doesn't sound great but doesn't sound bad either. Eighty-four out of the 400 went to Dartmouth, Harvard, Illinois, Michigan, Purdue, Stanford, or Wisconsin. (Don't ask me how I picked that list!) Most of all don't ask me what it means.

Comley is now collecting information from several hundred college seniors who took 3 or 4 years of UICSM and a comparable number of seniors, who took so-called traditional mathematics from high schools in school districts of somewhat similar socio-economic level. What is he likely to find? Probably nothing striking in the way of grades. Judging by freshmen and sophomores previously studied, the UICSM students will probably speak more highly of their high school training than the non-UICSM. However, this could mean nothing more than that we have succeeded in indoctrinating them with a pro-UICSM line.

VI. Summary

UICSM curriculum research has not followed the classical mode of experimental design, setting up experimental and control groups to assess the effect of treatment. It has seen teaching mathematics as no simple combination of clearly defined variables as in agronomy experiments, where amounts of fertilizer, insecticide, and irrigation might determine production. Rather, a successful teacher of mathematics is seen as an interaction with the stream of pupil behavior to move them toward behaving in accordance with mathematical and logical generalizations — that is, using them reliably to solve problems.

An exploratory mode of curriculum research is employed, but serious difficulties stand in the way of objectifying such research procedure. Most methods of recording and analyzing classroom data are so cumbersome that, in practice, they give way to the demands of producing educational materials. (Even films, which were used to record a ninth-grade algebra class in great detail, was edited for teacher training only, and do not adequately demonstrate the research methodology and results.)

Efforts made in the direction of summative evaluation, teacher variables, psychological studies of a teaching method, and follow-up studies have raised serious problems of research methodology which await further investigation before generally useful results can hope to be obtained.

We have made a "college try", if not a classic attempt, and have found out many of the problems of curriculum evaluation. We have generally shifted our efforts to methodological and procedural studies in hopes that we can contribute to a discipline of curriculum evaluation in a way that would be useful

to other projects. We have made some significant beginnings toward such solutions, but that is another story to be told at a somewhat later date.

Comments on "Evaluation Problems of the UICSM Curriculum Project - A Case Study" by J. A. Easley, Jr.

Presented by

R. E. Spencer, Head
Measurement and Research Division
Office of Instructional Resources
University of Illinois

Thursday, May 19, 1966

There are several major points in Dr. Easley's paper which deserve consideration in this, purportedly, a critical review. These points can be categorized into two distinct areas:

(SPECIFIC) (1) analysis of the UICSM project itself, or more specifically the research and evaluation of it; and

(MORE GENERAL) (2) analysis of the evaluation/research/testing procedures explored in the paper in terms of philosophy and assumptions.

Being a neophyte in mathematics, fearing it, and having subliminal anxieties about math, as well as having children in the new math in school without being able to understand what they are doing, I feel grossly inadequate to any analysis of UICSM.

"EXCEPT" for a few points: Ergo into the Lion's Den we go:

1. The four major aspects of math education in the first paragraph of Dr. Easley's report are stated in a manner which I am sure he did not intend or I perceive it in a way which was not intended. The areas of (1) <u>course design and textbook production</u>, (2) <u>evaluation and psychological research</u>, (3) <u>teacher education</u>, and (4) <u>operations of a program</u>, do not state "WHAT FOR?" I would have preferred statements such as:

   In order to improve the learning of mathematical concepts, the use of math logic in the solution of problems, the application of math to the analysis of systems, etc. four areas have been experimented with, - - - - etc. I was looking for a "learning" orientation, and not a teaching orientation.

2. <u>OPTIMIZATION PROBLEM</u>:

   I would also like to see the objectives of the math project stated differently. The "optimum path through a discipline"

approach seems to me to indicate or possibly imply that the path is the same for everybody, the goal is rather homogeneous, and the end point is known. It would seem to me that the objective would be to present the material in a manner which optimizes learning efficiency through a discipline to whatever extent the individual can personally afford, or chooses to afford, to his own maximum level. I introduce here an element of individual differences not explored in the paper; and an element of WILL.

3. The objectives as stated in the paper include students' making their own way in (1) collegiate study of math as a major or minor or (2) coping confidently with mathematical matters in everyday life. I would like to add a third objective, i.e.(3) to use mathematical models for the solution of problems because they have become useful, efficient, and economic problem solving tools. The individual becomes more willing to use the tool, and in fact, does use it more.

4. I don't care for Karplus' definition of scientific literacy, or Easley's "politically literate." What is a mathematically literate individual? I do not believe that one becomes or can necessarily be classified as a literate merely by reading a newspaper (for political literacy); going to concerts (for musical literacy): knowing artists names and what they painted (for artistic literacy); or solving mathematical problems (for mathematical literacy). Or at least this is not the kind of literacy I would support as an educational objective.

Let me explain. I may, for example, be classified as literate about cancer and cigarette smoking. I can give you all the data, name the studies that have been done -- and even recommend that people should not smoke cigarettes. BUT I STILL SMOKE! If literacy is knowledge ABOUT something, then I am cancer/cigarette

literate, but it simply doesn't matter. Karplus' and Easley's literacy is, as T. S. Eliot put it "This is not it; this is not it at all." It's similar to the classification of education I recently saw. The question posed by an interviewer was relative to how educated was I. It was determined by the question -- how many years of schooling had I completed. The two are not necessarily related. Some students complete a bachelor's degree in three years, and are usually considered more educated than a student who took 4 years, and yet the 3 year student would be classified as "less educated" in the questionnaire. Let us not, therefore, confuse literacy, which might be knowledge <u>about</u> a discipline, with ability in, or with, a discipline.

The general objective of the UICSM program, therefore, is not, as I see it, literacy -- but capability in the use of mathematical tools when they seem applicable and most efficient.

If I want to evaluate cigarette smoking, I can ask questions and build a test around knowledge of the effects of smoking. It may or may not have anything to do with the <u>behavior</u> of smoking. The test instrument may capably measure the overt behaviors related to literacy -- but does not get at the real issue -- SMOKING. Tests can be built about smoking, cancer, psychological variables inherent in smoking - i.e. those aspects which might be included in an instructional program about smoking. These tests would serve to evaluate how much, or what part of an instructional program got across, or how many students learned what. There is another requirement for evaluation however -- did they stop smoking?

5. A final point about the content of UICSM involves the term "teaching by discovery." Upon this concept hangs the analysis of evaluation and research which I will deal with next.

   To insist upon the discovery procedure, to consider it best for all, to consider it applicable in a generalized sense, may be to redefine the term to yield "teaching by conformity" -- discovery in

these instances may be conformity. In a comparison of discovery procedures to classical statistical analyses -- which were developed on agriculture and animal behavior -- I suggest that animals learn more by discovery than by any other procedure. Discovery, the heart and soul of sub-human development, is also the reason why we are not inundated with an overpopulation of animals. Many of them have validly "discovered" the wrong way to behave, but have not lived to tell about it. The discovery method may be useful, for some concepts within some disciplines at sometime with some students under some teachers. But in general, teaching-by-telling, although uncomfortable to swallow, is more efficient!

Another point worth considering, is how do we know the student got there by discovery? What is our means of observing and classifying covert behavior in such a manner that we can categorize discovery from some other kind of activity? By intuitive observation? Obviously we would be in hot water whenever we start classifying behavior of this type -- we would disagree. What is discovery by a student to one teacher is "too much talking" to another, and indications of unstable behavior to another. Thus we arrive at our major topic -- evaluation.

EVALUATION -

The problems that Dr. Easley mentions, relative to evaluation, are complex. How do we evaluate a curriculum which contains content that no other curriculum contains, for which no or few suitable measuring instruments exist? The evaluation techniques explained through "participant reactors" and subjective (perhaps unreliable) observors, leave much to be desired. These behaviors are not really research; they are teaching methods, or data collection, and the data collected are responses by a teacher, or teacher-substitute, to a teacher/pupil interaction. This is at best a type of research but not research toward the identification of a "better" method. It lacks certain necessities, present in classical evaluation techniques, and, I think, essential in all evaluation.

1) reproductibility - the research can be replicated

2) agreement among judges - others will come to the same conclusions

3) a known or common, or at least comparable, measurement scale

What is lacking is a criterion. One cannot use the Cooperative Algebra test, or the Differential Aptitude test for criterion as they favor the students who has had made and content of instruction.

But let us consider for a moment what it is that is being done. Why is mathematics being taught? What is the curriculum in mathematics - new or old - there for?

I suggest that mathematics is taught to enable students to do something. What? What is it that they are expected to do with mathematics, new or old, that they could not do without it? When this answer is developed, it becomes the criterion - and about it, toward it, is developed a criterion examination. This test need not be mathematics at all, but it is to measure, specifically, that which mathematics was taught for! Given this instrument, classical, agriculturally based research and experimental designs can be implemented. The new math gets students to this criterion faster, or more completely, or with greater interest, or willingness than does the old math. Traditional tests of old math are also inadequate to measure this new criterion - they merely measure how much of the old math a student has learned. They too do not answer the question, the greater question, if you will, of the more ultimate criterion, i.e. MATH FOR WHAT? We need to search further to define this criterion, and a test will be an automatic outcome, and the problems of evaluation mentioned by Dr. Easley will be more easily attacked.

*OCCUPATIONAL INFORMATION; *STATE AGENCIES; *GOVERNMENT EMPLOYEES; *CAREER OPPORTUNITIES
MINNESOTA

Minnesota civil service has more than 16,000 full time employees whose job titles fall into these categories: (1) administration and personnel, (2) agriculture, (3) auditing, accounting, and inspection, (4) clerical, (5) education, (6) engineering, architecture, and mechanics, (7) forestry and conservation, (8) health services, (9) social services, and (10) statistics and research. The state attempts to keep salaries commensurate with the rising cost of living and to limit the work week to 40 hours. Further information may be obtained by writing the Minnesota Civil Service Department, 180 State Office Building, St. Paul, Minnesota, 55101. A list of high school and college level job titles are included as well as a sample application form. (EM)

choosing a career

You as a student are no doubt thinking now about your future. You are probably asking yourself what career choices you should be considering. What work will be closely related to your interests, abilities, values and goals? What work will give you a sense of accomplishment and satisfaction? What work will allow you to advance to a position with the responsibility you feel you can handle? What working situations or combinations should you consider—working with people, working out-of-doors, working with your hands?

As you try to answer these questions you will want to look at the opportunities offered in many fields of employment. You will look at industry, at the professions such as medicine, teaching and law, at retail selling, at military careers. You will also want to take a look at the opportunities and rewards of a career in government.

This booklet is designed to give you information about working for the State of Minnesota. You may want

to know about civil service opportunities—the advantages and disadvantages. Reading this booklet may answer some of your questions, clarify ideas you now have, and give you some basic information about jobs you are exploring.

working for the state of minnesota

What does the government of Minnesota do? You may be surprised at the variety of services the state performs to make life richer and more secure for its residents. Everyone knows about such functions as highway construction; the conservation of natural resources; public welfare programs which provide assistance to the needy; guidance, counseling and treatment services for the handicapped and delinquent; enforcement of laws and regulations; and the protection of health and safety. These are only a few of the services that are, in large part, the responsibility of the departments that make up the government of Minnesota.

Minnesota civil service now has more than 16,000 full time employees. The duties they perform in most departments and agencies of the state government are similar to work in the same field in public or private organization. The state has been able in recent years to make

civil service salaries and benefits more similar to those outside government—often better for beginners with little experience.

There are also some "extras" in government work. Many people find deep satisfaction in actively participating in their government. Serving the public in a direct, essential way as state employees do, can give a sense of achievement not always found in other employment. Workers in state government often find themselves working in close association with leaders in their field outside as well as inside government. As a representative of the state, the civil servant is treated with respect in accordance with his position and ability by persons in important positions in government and industry. State government offers its career employees a chance to practice and grow in their professions.

Not everyone however, finds government work satisfying as with any large organization. There may be delays and frustrations due to the structure within departments or to the "bigness" of government. The state employee usually works closely with other workers in his department and in many cases does not have the freedom to work on his own that he might find in small business or private professional practice.

Minnesota civil service employs qualified, competent employees, and it offers opportunities for advancement to high-level positions. Promotions are based on examination. The same opportunities for employment and advancement are open to all qualified men and women regardless of race, creed or national origin.

State institutions, offices and installations are located throughout the state. For example, you can find state hospitals in the north at Fergus Falls, Moose Lake, and Brainerd, and in the south at Rochester, Hastings and Faribault, to mention only a few. About one in every three state employees works in the capitol city of St. Paul; many others are based in St. Paul and travel throughout the state in the performance of their duties. Whenever possible, the candidate for a job is given his choice of location.

what kind of a job?

Let's take a look at the career opportunities open to you in Minnesota state service. Most of the jobs described below are beginning positions. Duties and requirements of these selected jobs are set forth to give you an idea of some of the openings available in a few areas and departments.

Of course, we cannot describe in detail all the many jobs the state has to offer. At the back of this booklet you will find a list of beginning positions. If you would like to know more about any of the jobs described in these pages or listed at the back of the booklet, write to the office listed on page 35.

ADMINISTRATION and PERSONNEL

The state of Minnesota is a big business, and those who have an interest in and aptitude for business management, administration, personnel work or clerical work will find many openings in civil service.

The Department of Administration is the state's business office. It is responsible for planning, budgeting, purchasing, maintenance of state property, and such central services as tabulating, duplicating and mailing reports and other related office detail work.

The Civil Service Department is the central personnel agency for the state service. It conducts examinations and maintains lists of qualified candidates to fill over 900 kinds of positions in civil service.

COLLEGE LEVEL JOBS

There are also business positions in nearly all other departments of state government. One such job is that of *Buyer I.*

This employee performs an important administrative function. He arranges for the purchase of material, supplies and equipment. Preparation for this work requires a college degree with a major in business or public administration, including advanced courses in marketing.

A person with a college degree in accounting, public or business administration or personnel administration may qualify as a *Budget Examiner I.* This employee reviews and coordinates such financial operations as salary budget and purchasing equipment and supplies of smaller and less complex state departments.

The *Civil Service Technician* performs professional personnel work in the recruiting, testing and classification of state employees. A college degree with a major in industrial relations, psychology or public administration is considered good preparation for this position.

AGRICULTURE

Both high school and college graduates with an interest in farming or a farm background can find many openings in the Minnesota Department of Agriculture. Agriculture accounts for about 50% of the state's total income. It is the responsibility of the Agriculture Department to assist farmers in developing and using better farming methods.

COLLEGE LEVEL JOBS

The holder of a college degree in plant pathology or entomology may qualify for the position of *Entomologist I.* This employee makes inspections, surveys, and investigations and assists senior entomologists on major insect and plant disease control projects.

Other college-level positions in the Department of Agriculture include Agronomists, Agricultural Products Inspectors, Bacteriologists, Chemists, and Veterinarians. These jobs require suitable preparation in agronomy, agriculture, marketing or veterinary science.

HIGH SCHOOL LEVEL JOBS

For the high school graduate there are a number of jobs open in the field of agriculture. An example is the position of *Grain Sampler I.* This employee is responsible for obtaining a true sample of grain from railroad cars, trucks, elevators, boats and barges, and for detecting unusual conditions of the load or equipment. The *Grain Laboratory Aide* works in a laboratory assisting in grain testing and experimentation. The *Farmer I* does farm work on state experimental farms or at state operated institutions.

AUDITING, ACCOUNTING and INSPECTION

Accountants and auditors are found throughout civil service. All state agencies have financial accounts and some are responsible for examining the accounts of commercial firms and for enforcing certain standards and rules for financial transactions such as insurance, banking and securities exchange. There are many opportunities in this field for those with an interest in and aptitude for detailed work with numbers.

COLLEGE LEVEL JOBS

A beginning *Accountant* maintains financial records within a department of moderate size or acts as an assistant to a higher-level accountant in a large department. He must be familiar with accounting principles and have the ability to apply them. The most desirable preparation for this position is a college degree in business administration and a major in accounting.

The beginning *Auditor* applys professional auditing methods to the books and records of governmental units or private businesses and assists higher level auditors in more complex audits. A college degree in business administration with a major in accounting is the best preparation for this work.

Other positions which require a college degree in business administration or accounting are those of *Bank Examiner I*, *Tax Examiner I*, and *Insurance Examiner I*. The Bank Examiner assist in examinations of larger banking institutions. He must know something about the laws and regulations relating to banks and other financial institutions. The Insurance Examiner assists with the financial examination of insurance companies.

CLERICAL and OFFICE

As with any large business or industrial organizations, clerks, typists and stenographers are always needed in state service.

HIGH SCHOOL LEVEL JOBS

The *Clerk I* sorts and files documents, delivers departmental mail, serves as receptionist and operates simple office machines. The *Clerk Typist I* types letters, statements and reports, forms and form letters, file cards and indexes. In addition to the typewriter and adding machine, she operates other similar office machines. She also does other related clerical work. The *Clerk-Stenographer I* takes dictation and transcribes it, types from copy and rough draft, does clerical work and operates simple office machines. All these positions require a high school education. The Clerk-Typist must have completed a typing course and the Clerk-Stenographer must know typing and shorthand.

The *Key punch Operator* punches precoded material on IBM punch cards using a key punch machine. The operator uses the verifyer machine to verify the accuracy of the punch cards. In addition to high school graduation, it is desirable to have had a course in key-punch operations from an accredited school and some experience as a key punch operator.

EDUCATION

Although the state government of Minnesota does not employ the classroom teachers for the public schools of the state, there are some teaching positions available in state civil service. *Special Teachers* are employed for work in special state schools, hospitals and prisons. These teachers must have the training required for teacher certification in Minnesota, and in addition should have extra training appropriate to the institutions handling teaching problems encountered in working with children or adults handicapped by emotional disturbance, delinquency, mental retardation, blindness, deafness or other physical disabilities.

COLLEGE LEVEL JOBS

A number of educational consultants are employed by the Department of Education to work with local schoolmen throughout the state in formulating long-range education programs and goals, to provide educational leadership and to help develop and maintain high standards in the schools. Graduate training beyond a college degree and appropriate educational experience is usually required.

TECHNICAL LEVEL JOBS

Teachers are employed by the Department of Education to conduct adult education classes in retail selling and techniques and safety for workers in telephone systems, municipal electric, gas and water systems, and steam engineering. The *Education Field Instructor* works with an adult education program and instructs apprentices and trainees in job skills and related academic subjects on a part time or intermittent basis, either through corres-

spondence or classroom instruction. A college degree is not required; however, the instructor must have had considerable experience at the journeyman level in the trade or work activity to be taught plus some college level teacher training courses.

ENGINEERING, ARCHITECTURE and MECHANICS

Those interested in and trained in engineering or architecture and those with mechanical or engineering aptitude are needed in Minnesota Civil service. The number of public buildings and public highways built and maintained by the state is increasing rapidly due to the growing population and the complexity of modern life.

The Department of Highways is the custodian of more than 12,000 miles of trunk routes and is concerned indirectly with many miles of other roads in the state. Other departments are responsible for the construction and maintenance of colleges, hospitals, prisons, office buildings, waterways, bridges, parks and recreation facilities.

COLLEGE LEVEL JOBS

College-trained *Engineers* are nearly always able to find positions in state service which allow them to specialize in that branch of engineering for which they are best prepared and most interested. Assignments for *Architects* and *Landscape Architects* also cover a wide range of projects.

HIGH SCHOOL LEVEL JOBS

For the high school graduate with mechanical aptitude and interest, the Highway Department has an *Automotive Mechanic Apprentice Program.* Apprentices learn to repair, maintain and modify highway equipment. On-the-job training may be supplemented by classroom instruction at accredited vocational schools; the cost of

attendance at such schools is borne partially by the state and partially by the apprentice, who will become eligible for a journeyman's certificate upon successful completion of the four-year training program.

Other high school-level positions with the Highway Department include *Traffic Recorder*, who sets and adjusts portable traffic recording machines and counts traffic, *Highway Maintenance Man*, who does manual and semi-skilled maintenance work on the state highways, and *Highway Technician*, who serves as a field or drafting technician on surveys, relocations and construction.

FORESTRY and CONSERVATION

Those interested in the important work of helping to conserve and promote the wise use of Minnesota's lands, minerals, waters, forests and wildlife may find many career opportunities in the Department of Conservation.

COLLEGE LEVEL JOBS

College-trained persons with a major in fish and wildlife management, zoology or forestry are needed by this department. Some of the positions available are *Game Biologist,* who conducts field surveys to evaluate habitats and recommends management projects to improve the game-carrying capacity of an area; the *Forester,* who evaluates various phases of work in forest management, such as forest development, timber sales and fire prevention; and the *Area Game Manager,* who works on projects such as evaluation of lands considered for purchase, development of game management plans, wild life census work, and cover planting. There are openings in this department for bacteriologists and engineers to work on parks, mining projects and water resources projects.

HIGH SCHOOL LEVEL JOBS

High school graduates with an interest in forestry or wild life can find opportunities to work under supervision on reforestration projects, in the operation of fish hatcheries, as forest guards and park workers. The position of *Game Warden* is also open to high school graduates over 21, who have had hunting, fishing, farming or woods experience and some experience in law enforcement. The Game Warden helps enforce game and fish laws and

regulations in an assigned district by detecting violations and apprehending and arresting violators. He may also assist with field studies and game surveys and fish rescue work, and may feed game birds and animals when necessary.

HEALTH SERVICES

Employees of the Department of Health help perform the vital task of protecting and caring for the physical and mental health of the citizens of Minnesota. The department acts to prevent disease, disability and death through education and the application of preventive medicine techniques and the elimination of health hazards in the environment.

COLLEGE LEVEL JOBS

In the performance of these services, highly trained specialists such as *physicians, dentists, psychiatrists, psychologists, chemists, epidemiologist, public health educator* and *nutritionists* are needed. Many of the jobs require training beyond the four-year college degree and an ability to meet state licensing requirements.

HIGH SCHOOL LEVEL JOBS

Many laboratory workers are employed in this department. High school graduates who have completed some laboratory training course, such as *Laboratory Technicians, Practical Nurses,* and *X-Ray Technicians* can find a career working in hospitals and public health clinics and laboratories.

SOCIAL SERVICES

Those who find a career in the Minnesota Department of Public Welfare give supervision and consultation to the special schools for blind and deaf, schools and hospitals for retarded, special hospitals, nursing homes and hospitals for mentally ill, to mental health clinics, voluntary agencies and to county welfare departments who are engaged in providing direct services to clients. Other social service workers in the Department of Corrections help with the rehabilitation, training, counseling and custody of adults and juveniles who are placed under state jurisdiction by the courts.

COLLEGE LEVEL JOBS

Persons with college training are needed to fill many jobs in welfare services. While the majority of *Social Workers* are required to have graduate training, there are opportunities for *Social Workers* with undergraduate degrees in child welfare, public assistance, medical or psychiatric (institutional) settings. The *Rehabilitation Counselor* determines eligibility for vocational aid, evaluates capabilities, and helps his clients choose occupational goals and find suitable employment. The *Volunteer Services Coordinator* recruits individuals and groups, coordinates the activities of these volunteers in a state institution and dispenses information to groups and the public concerning the institution's program and activities. The *Patient Placement Agent* places mental patients and patient parolees in work assignments to aid in their recovery and rehabilitation. All of these positions require a college degree and usually additional work with a major in the special field.

HIGH SCHOOL LEVEL JOBS

High school graduates will also find many jobs available in the hospitals and institutions about the state. The

Special School Counselor provides counseling services while supervising the daily activities of delinquent or retarded children living in a group at an open institution. The *Patient Activities Assistant* directs the recreational activities of patients as well as assisting in the job placement of patients within an institution. The *Correctional Officer* is responsible for the custody and discipline of inmates assigned to his direction in a state correctional institution.

Other jobs for high school graduates include *Laboratory Technician, Hospital Aide,* and *Psychiatric Technician.* A Laboratory Technician works under supervison in a laboratory doing such tasks as preparing samples for analysis, classifying and labeling specimens and operating simple laboratory equipment.

The *Hospital Aide* works under the direction of nurses in a hospital setting doing such work as accompanying patients about the hospital, writes letters for them and performs other personal services. The aide also performs the necessary ward housekeeping tasks and related nursing duties for patients such as feeding, bathing and dressing.

A *Psychiatric Technician I* helps in caring for mentally ill patients in a hospital. Duties include such personal service as bathing, feeding and dressing patients. Other duties include observing changes in patient behavior for the professional treatment staff. There is an on-the-job training program for Psychiatric Aides, which lasts one year and consists of both classroom work and actual work experience on the wards of state mental hospitals.

STATISTICS and RESEARCH

Statisticians and other research personnel are employed in a wide range of activities by most state agencies. They study and interpret information to allow for more efficient techniques and to provide facts for future planning—an important part of any business as large and complex as Minnesota state government.

COLLEGE LEVEL JOBS

Most research positions require a college education. The *Administrative Analyst I* conducts studies of departmental organization, methods and procedures, and recommends solutions to operating and efficiency problems. Preparation for this work should include a degree in public or business administration, industrial psychology or industrial engineering.

A position which has grown important with the increased use of large electronic computers in the operation of government is that *E D P Assistant Programmer*. This employee interprets data and puts it into the mathematical form which the computing machine can understand and use. A college degree with a major in mathematics, accounting, statistics or related subjects is desirable preparation.

The *Research Anlyst I* conducts surveys and uses statistical techniques to interpret and present results. College training should include course work in statistics.

OTHER JOBS--
HIGH SCHOOL and
COLLEGE LEVELS

The preceding sections mention only some of the career opportunities for high school and college graduates in state civil service. There are many other interesting positions—for example, that of *Highway Patrolman*. The man filling this position patrols state highways, promotes safety, directs and controls traffic, provides assistance to the public and enforces traffic laws. He must be a high school graduate, between 21 and 30 years of age and in good physical health.

The college graduate with a degree in English or journalism may qualify for the position of *Informational Writer I*. This employee is responsible for drafting written material of complex subject matter. He must be able to collect information through interviews and research. A knowledge of the techniques of news and publicity writing is essential.

The state of Minnesota also employs *lawyers, economists, librarians, artists, draftsmen, legal secretaries,* and *home economists,* to name a few. Whatever your field of interest or specialization, the chances are good that you can find a place in state civil service.

other job information

Anyone considering a career in state civil service will certainly want to know something about the tangible benefits he will receive. Exact salaries and other benefits for jobs change from time to time. Current job information may be obtained from the State Civil Service Office listed on page 35.

SALARIES

In recent years, Minnesota state government has moved salaries steadily upwards until now they are becoming comparable to those in private business. The state also attempts to keep salaries commensurate with the rising cost of living.

To obtain exact salary information about a particular job for which you feel you may be qualified, write to the office listed on page 35 or contact your local state employment office for this information.

THE WORK WEEK

Most state employees work a 40-hour week. Those working in offices work five days a week, while those employed in institutions may work 8-hour shifts, seven days a week, up to 40 hours. The professional person may sometimes find that obligations to attend meetings or the schedule demands of travel may make it necessary to work more than 40 hours.

There are usually eight or nine and sometimes as high as eleven paid legal holidays per year for state employees.

VACATIONS and SICK LEAVE

An employee in state service accumulates vacation time according to the following schedule: four hours of paid vacation for every two weeks worked which adds up to at least 13 days of vacation each year for the first five years of employment; after five years of employment, you earn five hours every two weeks which adds up to 16-1/4 vacation days each year.

Sick leave is accumulated at the rate of four hours for every two weeks worked, and will be paid up to 800 hours of absence (roughly 100 days). Accumulated sick leave can be added to vacation time in accordance with certain fixed schedules.

OTHER BENEFITS

All state employees except the highway department (they have their own), are eligible to become members of the State Capitol Credit Union, where they may save or borrow money at very reasonable interest rates. Retirement is paid for by both the State Employees Retirement System and by Old Age and Survivors Insurance (Social Security). The retirement system includes disability benefits.

State employees are protected by Workman's Compensation and are entitled to Unemployment Insurance protection on the same basis as workers in private industry.

JOB SECURITY

If a civil service employee does his work well, he may be reasonably assured of a career in state service. There are, of course, occasional staff reductions when services are altered or discontinued. Dismissals are also made for incompetence or misconduct.

how to get the job

THE COLLEGE SENIOR PLACEMENT and the HIGH SCHOOL SENIOR PLACEMENT EXAMINATIONS

The Civil Service Department holds annual College Senior Placement Examinations (CSPE) and High School Senior Placement Examinations (HSPE). The CSPE and HSPE programs are especially designed to acquaint college and high school graduates with the wide variety of career opportunities in state service and to offer the graduating senior a chance to qualify for a variety of positions by filling out *one* application and taking *one* examination.

This is how these programs work. You, the high school or college senior, obtain an application at your college placement office, from your high school counselor, or from the office listed on page 35. You complete it and mail it, together with a transcript of college courses or high school record, to Minnesota Civil Service Department, 180 State Office Building, St. Paul, Minnesota 55101. Be sure to mark your application CSPE or HSPE.

You will be notified by mail of the time and place of a written examination designed to measure your general abilities. These tests are given several times a year at convenient locations.

Applicants passing the written examination will be rated on their academic achievement and will be placed

on the lists for those classes of employment which relate to their educational background and personal interests. Individuals are given an opportunity to express job preferences on the application. Referrals will be made on the basis of examination scores, school record, and openings available in the geographical area in which the candidate is willing to work.

It is a good idea to get your application in as early as possible, since testing and placement may require several weeks or even months.

APPLYING FOR A PARTICULAR JOB

If you have one specific job in mind for which you wish to apply, you will often have to take both a written and an oral examination. The first step is to obtain an application, complete it, and mail it to Minnesota Civil Service Department, 180 State Office Building, St. Paul, Minnesota, 55101. To help you in filling out your application, we have included a copy of an application form on page 36.

You will be notified on the time and place of the written examination. Tests for most positions are held at least once a year—some more frequently.

If you obtain a score of 70 or above on the written test, you may be asked to report for an oral examination.

Qualified interviewers will talk with you about your job knowledge, work interests, preparation, and ideas in a recorded interview. Appearance, personality interests, job knowledge, preparation, and other related information are rated. Written and oral scores will be evaluated and if eligible, you will be placed on a list of applicants for the position.

WHERE TO WRITE

For more information about jobs mentioned in this booklet or other civil service jobs, you may write to:

Minnesota Civil Service Department
180 State Office Building
St. Paul, Minnesota, 55101

APPENDIX

Fill in with typewriter or ink. Answer *completely* all questions on *both sides* of this sheet.

PROGRAM DESCRIPTIONS; *SOCIAL WELFARE; *FOUNDATION PROGRAMS; EDUCATIONAL PROGRAMS; AGRICULTURAL RESEARCH PROJECTS; INDUSTRIAL TRAINING; ECONOMIC DEVELOPMENT; *DEVELOPING NATIONS; FOREIGN COUNTRIES; *TECHNICAL ASSISTANCE; DEVELOPMENTAL PROGRAMS
MIDDLE EAST; FORD FOUNDATION

This report describes Ford Foundation assistance to selected activities in the United Arab Republic, Lebanon, Syria, Jordan, Iraq, Saudi Arabia, Iran, Turkey, and North Africa. Since 1951, the Foundation has assisted in the social and economic activities of these countries and has contributed 32 million dollars for research, development, and education. The main objectives of this assistance was to strengthen the institution framework for the development of trained personnel and new knowledge and approaches to promote change. Projects which are discussed include: (1) the National Institute of Management Development in the United Arab Republic. (2) a multi-purpose agricultural research laboratory in Syria, (3) a school and farm project in Jordan, (4) programs at Beirut College for Women in Lebanon, (5) the Gorgon-Dasht rural development project in Iran, (6) the teacher training and curriculum project for the National Science High School in Turkey, (7) the International Cultural Center in Tunisia, (8) educational leadership scholarships in Algeria, and (9) agricultural research in Israel. Tapestry for Tomorrow is one of a series of booklets on activities supported by the Ford Foundation. The purpose is to present informally and in a general, nontechnical way the story of some phase of the Foundation's work. Other publications are listed on the back cover.

Library of Congress Catalog Card Number 64-15857 February 1964

WEST OF THE RIVER NILE the lands of Egypt – now named the United Arab Republic – fuse abruptly into the vast, empty dominions of the Sahara Desert. Except for an occasional patch of scrub and, now and again, the distant movement of a few Bedouin nomads and their camels and flocks, all is barren, lifeless, and silent. Through the thousands of years of Egyptian history it has always been so.

The scene is beginning to change, however. Impelled to increase her arable lands to feed a population that has soared from some twenty million in 1950 to twenty-six million today, and to resettle some of the highly dense population of the Nile Valley, Egypt has started to reclaim the desert terrain. Not much of it (for the desert covers about 360,000 square miles), but enough to place this effort among the largest land-reclamation projects in history. A primary focus of the work is a series of enormous, irregular cavities that dent the western desert. Among these is Wadi Natrun, an oval-shaped basin some twenty-five miles long near the Rosetta branch of the Nile. The sands of Wadi Natrun, like the other depressions, cover a life-giving prize – strata of porous rock richly charged with water.

The problems of using this precious resource to establish desert agriculture were the object of a field trip to Wadi Natrun in the fall of 1962 by a small party of Egyptians and Americans. The Egyptians were Mohammed Naguib, professor of soil science at the Institute of Land Reclamation, University of Alexandria, and Kamal Metwally and Hattim Attar, students at the Institute. The Americans were Perry R. Stout and Frank T. Bingham, soil scientists from the University of California who were spending a year, under a grant from the Ford Foundation, assisting the Institute's teaching and research.

The feasibility of farming the desert was vividly apparent among the wells that tapped the water beneath Wadi Natrun. There were fruit-laden groves of orange, lemon, and tangerine trees, sheltered from the killing winds by stands of eucalyptus and casuarina (Australian pine). Like an encampment of miniature teepees, an orchard of mangoes was taking root under conical shields of cane. Elsewhere

were large fields of tomatoes and alfalfa; and here and there test plots produced corn, beans, eggplant, peanuts, onions, and carrots.

But before desert agriculture can be developed to support substantial colonies of settlers, baffling problems must be solved. The solutions lie with men trained in plant nutrition, soil science, and irrigation and drainage. Which is why the two students from the Institute of Land Reclamation – Metwally and Attar – had come to Wadi Natrun to study the kinds of problems they would face in their professional work.

Why, they asked, as they stood in a citrus grove, should these trees, which had been meticulously fertilized, irrigated, and sprayed, be mottled with the spots of some mysterious ailment? Professor Bingham plucked a few leaves, held them up to the sun. The spots, he explained, were a symptom of a micronutrient deficiency, probably manganese. All healthy plants require small quantities of elements (micronutrients) like boron, copper, zinc, and molybdenum. In temperate climates these are provided by the action of rain water on soluble minerals. Arid-zone agriculture, though, requires regular analysis of the irrigation water to check the micronutrient content. Mottling or withering of the leaves are symptoms of deficiency.

The group moved from the citrus grove to inspect a nearby field. Here they encountered still another mystery. Workers were harvesting large, healthy-looking peanuts. But nearly every third one, when cracked open, was empty. Attar pulled up a plant; it, too, was large and healthy. Why, then, he asked, should it yield nuts that didn't have meat?

In response, Professor Stout smoothed out a patch of sand and inscribed a diagram of a peanut plant. "It has a peculiar root system," he said. "The roots that feed the plant grow in the lower soil. But the ones that feed the nuts grow a lot shallower – only a few inches from the surface. So it's the quality of *this* soil, not only the lower, you also have to worry about if you want to have a good crop."

Attar and Metwally then inquired what the soil lacked. Stout's opinion was calcium; Bingham's was copper. "You see," Stout remarked, "you are working in an area where even the experts disagree. Why don't you take a couple of samples of this soil back to the laboratory and test them?"

Soil analysis and plant nutrition were only a few of the subjects Attar and Metwally had been studying since they had entered the opening class of the Institute of Land Reclamation in 1961. The two-

Opposite, *desert bears mangoes under effort aided by Egypt's Institute of Land Reclamation, whose director, Mustafa Elgabaly, is shown at right.*

year course also includes hydraulics, irrigation and drainage, leaching of salts, alkali correction, farm machinery, land economics, and rural sociology. And Attar, Metwally, and their classmates were also engaged in individual research projects on which they would have to write a thesis.

The Institute was conceived by Professor Mustafa Elgabaly, chairman of the University of Alexandria's soil-science department, to help meet a crucial need for specialists in Egypt's immense land-reclamation program. During the next ten years Egypt expects to increase the country's cultivable land by one third, an effort equivalent to creating an Imperial Valley, California, every two years. Moreover, through drainage, chemical fertilization, and other means, Egypt also aims to *double* the yield of lands now under cultivation.

"Both jobs require the solution of problems in engineering, agriculture, and community development," says Professor Elgabaly, a University of California Ph.D. and a veteran of twenty-five years of teaching, research, consulting, and writing on agriculture. "First, the land must be made productive, then the crop and irrigation systems worked out, and finally farmers and their families must be settled and provided with the services and incentives to create a genuine community. Thus the Institute seeks to produce not academicians but professionals who can understand the process as a whole and integrate each phase."

With an enrollment of over forty, the Institute of Land Reclamation is a postgraduate institution that recruits its students – all holders of the B.Sc. in engineering or agricultural sciences – from government agencies responsible for Egypt's land reclamation. It also conducts research and provides consulting services to the government. The Ford Foundation has provided the Institute with $588,000 for visiting professors from abroad, overseas training fellowships for Egyptian faculty, library materials, and laboratory equipment.

Support to the Institute illustrates one of the main phases of the Ford

Foundation's work in the Middle East: helping to surmount the acute problems that limit food production. In this vast area, encompassing Egypt, Arabia, the Levant, Anatolia, the rugged mountains of Iran, and all of Africa north of the Sahara, only about a tenth of the total acreage can be farmed, and then only with one crop a year because it is mostly unirrigated land. This has meant a living standard hardly above bare subsistence for most of the region's people. Meanwhile, the spread of modern health measures, by reducing the death rate, has steadily increased the population.

To the extent that agricultural and rural programs are guided by purposeful, technically proficient leadership, they represent a new phenomenon in the long and troubled history of the Middle East, and the other side of the coin to the political tensions, the paralyzing poverty, and the torpor that continue to plague the area.

From the changes instituted by Kemal Atatürk and Reza Shah in Turkey and Iran in the 1920s and 1930s to the new course the United Arab Republic has evolved since 1952, the pace and scope of modernization and reform have steadily increased, giving Middle Eastern nations – different as they are from one another – many features in common. Among these are:

–A drive to bring neglected segments of society into the mainstream of national life; this includes both villagers and impoverished urban dwellers.

–The expansion of education at all levels, including women's education, as the prime instrument of constructive social change.

–Actions to increase agricultural output: irrigation and land-reclamation projects; research, education, and extension programs to transform agricultural practice.

–Stepped-up industrial capacity, not only through new plants and equipment but also through programs to train skilled workers and managerial personnel.

–Basic organizational reforms and sustained training programs to strengthen the efficiency and quality of the public service.

—Comprehensive national planning and related economic and social research to speed and organize economic and social development.

Since 1951 the Ford Foundation has been assisting the nations of the Middle East, at their request, with their efforts to advance the social and economic well-being of their peoples. Altogether the Foundation has provided nearly $32 million for agricultural and rural development, industrial and business development, education and vocational training, public administration, and economic and social research. These funds have financed the services of scores of scholars and experts from the United States and other countries; provided for advanced training both in the Middle East and abroad of teachers and officials in agriculture, business management, and other critical fields; and supplied needed books and equipment. The main objective of the Foundation's assistance is to help strengthen the institutional framework for the development of the trained men and women and the new knowledge and approaches that are the mainsprings of forward change.

To keep in close touch with the people and institutions leading the region's nation-building efforts, the Foundation has five full-time representatives in the Middle East: James S. Lipscomb (Cairo) for the United Arab Republic;* W. Hugh Walker (Beirut) for Lebanon, Syria, Jordan, Iraq, and Saudi Arabia; Rey M. Hill (Tehran) for Iran; Eugene P. Northrop (Ankara) for Turkey; and James D. Hardy (Tunis) for North Africa. Grants in Israel are administered from the Foundation's New York office.

This report describes Foundation assistance to selected activities in these countries. In every case, the Foundation's purpose is the same as in some forty other developing nations in which it has made grants — to strengthen the conditions of world peace through the advancement of human welfare.

* John F. Hilliard, representative from 1959 through November, 1963, is on leave from the Foundation to serve with the United States Agency for International Development, in Washington, D.C.

The United Arab Republic

Enterprise and Development

To create an enlarged industry – which means fewer imports and more exports, more jobs for a burgeoning labor force, and rising national income – the United Arab Republic has a substantial base to build on: a modern textile industry, a new steel mill, fertilizer and other chemical plants, factories producing cement, paper, sugar, and other products. Its public utilities, transportation, and communications are relatively well developed. Also, the country's skilled engineers and technologists have been an important asset in stepping up manufacturing volume, which between 1954 and 1961 rose 56 per cent. But the advances thus far and the ambitious targets for the coming years have revealed (outside the pressing need for capital) one critical deficiency: a shortage of senior executives with the managerial competence demanded by the modern industrial process.

A team of consultants provided by the Ford Foundation reported in 1958 the top ranks of Egyptian industry "are overworked and hard-pressed because they are unable to delegate responsibility and authority to subordinates. . . . Egypt lacks more than anything else persons who have had the training to build organizations, to coordinate activities of specialists, and to develop and motivate personnel in the lower and middle ranks of management."

On the recommendation of the consultants, the National Institute of Management Development (N.I.M.D.) was established in 1959. Accelerating education for business management is susceptible to no ready-made formulas. "It is quite different from accelerating training in vocational areas, where a standardized course and schedule can be set up, tested, and used to speed training," explains A. Fouad Sherif, board chairman of N.I.M.D., who holds a University of Chicago Ph.D. in business. "Education for management is highly individual. The program must meet very specific needs of a heterogeneous group. No standardized approach will apply."

Sherif and his fifteen-man faculty have departed from the hallowed practice in Egyptian higher education of largely theoretical and impersonal instruction. Classes center on discussion between students and faculty. Rote learning is displaced by problem-solving sessions on actual company situations (the case-method approach). Full-time residence is required, bringing students and faculty into regular contact outside class hours.

Participants in N.I.M.D. courses are of two levels: senior executives, generally in their forties, who hold policy and operating posts such as board chairman and managing director, and younger men who report to the top ranks. N.I.M.D. conducts a separate program for each group, the first lasting five weeks and stressing the role of the business firm in a developing economy, the second lasting seven weeks and focusing on major aspects of the managerial process. Both programs embrace an exacting array of studies ranging from the economics of development to the practical problems of organization, planning, and coordination in the business firm. Modern techniques in such areas as industrial relations, marketing, production, and finance and controls are also covered.

The typical executive studying at N.I.M.D. has had an engineering background and has risen rapidly to a management position where he finds himself sorely overworked and inadequately trained to cope with the hydra-headed intricacies of administration. Samir Taher, for instance, an alumnus of the senior-manager's course, left university teaching in metallurgy to join the Egyptian Iron and Steel Company where, in a few years, he advanced to the top ranks. "My most difficult problems are not technological ones," he says, "but things like cost and quality control – how, in other words, to institute practices that will make our modern steel plant operate efficiently."

The ability of N.I.M.D. to help meet such needs explains why busy executives like Taher are willing to leave their work for from five to seven weeks at a stretch to undertake full-time study. Already producing some 330 graduates a year, N.I.M.D. has a growing waiting

list of applicants. Meanwhile, it has launched more than a dozen research projects (problems in marketing, distribution, and manpower, for example), produced a series of case studies on Egyptian companies, and has planned a management journal.

To help N.I.M.D. become established as a leading center of education, research, and information serving Egyptian industry, the Foundation has provided it with $928,091. The funds are being used to underwrite Ph.D. and post-doctoral study abroad for N.I.M.D.'s faculty, to provide library and teaching materials, and to finance the services of American business teachers who are assisting its staff while members of its faculty are completing their overseas training. The government has budgeted funds for a permanent center to replace the Institute's makeshift quarters spread between a downtown Cairo office building and a hotel.

The Profession of Government

With modernization largely dependent in Egypt on government action, the quality of civil servants determines how well or poorly the nation's development proceeds. The revolutionary government that came to power in 1952 early discovered that its reform programs were being impeded by the low state of administrative competence it had inherited from the corrupt system it had overthrown.

Accordingly, the new government established the Institute of Public Administration (I.P.A.) in 1955 to improve the nation's career civil service. Under the direction of M. Tewfik Ramzi, a Glasgow University Ph.D. and author of five books on government administration, I.P.A. has produced some 3,000 graduates and become a major route to promotion for the ambitious government worker. The Institute has been assisted by the United Nations and by the Ford Foundation, which has granted $324,350 for consultants, for training abroad of its present and future faculty, and for establishment of training centers for clerks and secretaries.

Administrative talent is being developed for civil service (symbolized by government building in Cairo). . .

. . . and industry. Here, bicycle plant is inspected by management executives.

I.P.A.'s main program is a ten-and-a-half month course during which middle-level officials report three days a week to its ancient, high-ceilinged building in Cairo for lectures, seminars, and workshops. Taught by over 100 university professors and high-ranking government officials serving on loan or part-time, the demanding course covers the principles of public administration; personnel management and development; work procedures, office administration, and other organizational methods; and financial controls, such as the use of budgeting as a management tool. To graduate, each student must successfully complete a research project and write a thesis.

The Development Planners

No phase of the governmental process is more critical in a developing country than national planning – how best to use scarce resources to accelerate social and economic growth. By now, most emergent countries have learned that a plan is more than a compendium of projects; it is, rather, a national design for comprehensive action. If the design is to be more than a paper monument, means for its execution must be built into the fabric of the government and nation. In the United Arab Republic, besides a National Ministry of Planning, there are also planning units in each ministry, public agency, and in some twenty provinces and large cities. All of these participate in formulating and carrying out the national plan, converting it from a design to a process.

Planning, like land reclamation, industrial management, and public service, requires professionally trained people. To meet the need, Egypt established the Institute of National Planning (I.N.P.) in 1960. It is headed by I. H. Abdel-Rahman, who was then Under Secretary of State for National Planning and head of the technical planning staff.*

By 1963, I.N.P. had become a brainy constellation of activities jostling for room in five floors of a Cairo apartment building. Training was underway for senior executives, specialists, and several score bright young university graduates. A library and documentation center had assembled and catalogued 6,000 volumes and published close to 400 research papers. Also an operations research and computation center had been set up, for which a 1620 IBM computer had been ordered. Meanwhile, a new building was being constructed.

To assist him in running I.N.P., Abdel-Rahman has a permanent teaching and research staff of fifteen. In addition, senior officials, development experts, and university professors participate regularly in the activities of the Institute on a part-time basis. Future faculty

* For a two-year period, beginning September, 1963, I. H. Abdel-Rahman is serving as United Nations Commissioner for Industrial Development, in New York, after which he will return to the Institute of National Planning.

are being trained abroad under a $438,000 grant from the Foundation, which also includes assistance for short-term consultants and library and teaching materials.

I.N.P. conducts one-to-three-month courses for senior planning personnel in special areas such as labor-force planning and national budgeting, and an intensive, year-long course for about fifty university graduates working in planning posts.

The most thoroughgoing program of its kind in the Middle East, the course starts in November with specialized work in one of five planning areas – agriculture, industry, manpower, economics and finance, and mathematical techniques of planning. From January to June, the students attend lectures and seminars in general planning, which include economic theory, development economics, statistics, national-income analysis, regional planning, and organization of planning machinery. Summer and fall are devoted to the preparation of a thesis. Most of the students then return to their jobs. A few, however, are selected for further training as future I.N.P. staff members, which means a year on the job with I.N.P., then Ph.D. education in the U.A.R. or abroad.

I.N.P. has also emerged as an important international center. For example, it is cooperating with the U.N. Economic Commission on Africa in establishing in Cairo a branch of the African Institute for Economic Development and Planning.

Tools for Action and Education

Improved statistical services – the very stuff of planning and operational decisions in industry and government – is the aim of another Foundation-aided effort in the U.A.R.: the Institute of Statistical Services. Established at the University of Cairo in 1962 as a national training and research center in the field, the Institute conducts a two-year graduate course in statistics. The Foundation has provided $217,000 for staff development and other assistance.

A pioneering educational project under way in Cairo with Foundation help is the preparation of a one-volume Arabic encyclopedia. At present no modern, authoritative encyclopedia of any kind exists in Arabic either for scholars or general readers. According to Hassan El Aroussy, administrator of the project, the encyclopedia will be "precise, comprehensive, and up-to-date, yet small enough to assure utility as a reference throughout the Arab world." The new work, edited by Abdel Rahman Zaki, is based mainly on the Columbia-Viking Desk Encyclopedia, but it is being adapted to the needs of Arab students by condensing or eliminating such items as those on less prominent people (John J. McGraw, baseball manager) and by the addition of a substantial amount of Arabic material – for instance, accounts of poets, scientists, philosophers, and other figures from both the classical and modern eras. The finished volume, which is expected by 1964, will have some 22,000 separate items and will run to nearly 1,600 pages. It is being produced under the auspices of Franklin Publications, a nonprofit organization of American publishers that assists educational publication in the developing countries.

Regional Development

The High Dam at Aswan will have tremendous social and economic consequences for a wide region. The entire agricultural system will be transformed from one based on the cyclic rise and fall of the Nile to intensive year-round cultivation. With dam-generated electric power available, new industries will be established, bringing in a large labor force that will have to be supplied with housing, food, and services. Then the lake behind the dam – which will be one of the world's largest man-made bodies of water – will open new potentialities for fisheries, transportation, and tourism.

In preparation for changes that will follow the completion of the High Dam, the U.A.R. government has recently established a team of Egyptian experts to study and advise on all major aspects of develop-

ment in the Governorate of Aswan. The Ford Foundation has agreed to assist in this work over the next several years. Thus far it has provided funds to enable the Egyptian team to recruit foreign specialists in agriculture, industry, lake management, and other fields critical to the region's development.

The Foundation also helped finance an intensive ethnological study of the living patterns of the 60,000 Nubian Egyptians whose lands will be flooded by the project. Results of the study, which was conducted by the American University in Cairo in cooperation with the government, are being used in planning new villages for the displaced Nubians.

Syria—Lebanon—Jordan—Iraq—Saudi Arabia

The Agricultural Sector

Like other countries of the Middle East, Syria is expanding her agriculture both by increasing the area of irrigated land and by increasing per-acre yields. In the northern part of the country, this has involved the launching of a large project to harness the Euphrates River and the establishment of two new institutions, both of which are being aided by the Ford Foundation: a Faculty of Agriculture at the University of Aleppo, and a multi-purpose agricultural research laboratory under the Ministry of Agriculture.

The impressive start made by the Faculty of Agriculture owes much to a young ecologist with an encyclopedic command of the details of his country's agriculture, Abdul Hamid Mansour, who served as its first dean. "If our agricultural engineers were trained abroad," he observes, "they would return without a close knowledge of our local problems – what varieties of wheat we grow, for instance, and how to improve this crop. Here we work on specific problems that count most in increasing our yields."

Because of this concern for the specific, one of Mansour's first steps was to activate a 350-acre experimental farm eight miles from Aleppo. Mansour and his farm manager, Farouk Chebib, drilled nine wells (the first in the area) and set up an irrigation system; started experiments in alfalfa, wheat, barley, and cotton; initiated feeding and breeding programs with poultry, cattle, sheep, and goats; and assigned each student a plot of land to till, seed, irrigate, and harvest. "Most of our students have never worked with their hands before and earn their first blisters here," Chebib notes. "But unless they have the experience of cultivating the earth, using tools, and raising a crop, they will never truly understand what farming is all about."

"The experimental farm is the true seat of the University of Aleppo's agricultural efforts, where research, teaching, and learning will form an integrated enterprise involving both students and facul-

ty," says Mansour. "We have made a start on our crop and animal programs, but there is horticulture, too. Aleppo is an important center for pistachio nuts, almonds, olives, and figs. What are the best varieties and the best ways to grow them? Another question is, how can we make the best use of our long growing season? How many crops – and what kinds – can we grow on the same ground during the year?"

By 1964, when it will graduate its first class, the Faculty of Agriculture will have about 275 students. Under Foundation grants of $448,000, consultation and teaching assistance are being provided by a group of American agricultural scientists headed by R. D. Lewis, former director of the Texas A & M experimental station. The funds also provide for overseas graduate education for future teachers and for equipment and books.

Similar support, amounting to $270,000, is being provided for the nearby multi-purpose agricultural laboratory. The laboratory is an extension of the laboratories of Syria's Cotton Bureau, which was established in 1952 to work on the nation's major cash crop, and has since helped increase lint production more than three-fold. Heading the Bureau since 1959 is a cotton technologist in his early thirties named Rateb Jaber. As acting director of the multi-purpose labora-

tory, he hopes to make it "an institution that can focus all pertinent branches of science on such other major crops as wheat and barley – indeed on any crop that needs intensive research."

The multi-purpose laboratory is developing programs in plant pathology, soil science, entomology, and other fields. A Foundation consultant-group directed by John R. Vaughn, a Wyoming plant pathologist, is assisting the effort.

Agricultural science is also being developed on a regional level in the Middle East. The American University of Beirut School of Agriculture, for example, which was established with a Foundation grant, conducts research on irrigation practices and other problems common to the area, and provides graduate, undergraduate, and technical-vocational training to some 170 students from many countries.

"Agricultural development is as much a human process as it is a scientific activity," observes Felix J. Brucher, Swiss-born veteran of fourteen years of rural-development service abroad who supervises the Foundation's work in Syria. "Better agricultural methods can be implanted in village societies bound to age-old ways by people who understand the cultivator and the ways he is likely to accept improved practices."

Syria's cotton laboratory and experimental farm (opposite) *exemplify Middle East's drive to boost farm output. Lebanese extension officers* (right) *represent another main feature.*

Consequently, the Foundation assists agricultural extension systems in Syria and Lebanon, particularly formal training programs and on-the-job training for extension workers, who communicate technical knowledge to village farmers and, in turn, "feed back" their problems to the specialists in horticulture, animal husbandry, and other agricultural fields. "Farmers have to trust you before they'll trust your knowledge," says Isam Sfeir, twenty-eight-year-old extension officer for a banana and citrus district of coastal Lebanon. "For instance, we have made a good start in teaching them how and when to use sprays. But farmers who have the means to buy pesticides find their efforts defeated because their poorer neighbors can't afford the investment, and the disease remains. So my hope now is to get all the farmers together and start them thinking about a cooperative."

As Sfeir indicates, the extension worker's task includes sparking common action among villagers toward solution of their problems. To prepare grass-roots agents of social change (extension workers, teachers, health officers), the American University of Beirut, with Foundation assistance, has established a Rural Leaders Training Institute. It enrolls about fifteen young rural officials a year from all over the Middle East.

The development of agricultural cooperatives – which supply farmers with short-term credit, low-cost farm materials and implements, and marketing services – requires officials particularly adept at generating and guiding local initiative. In Jordan, where a lively cooperative movement will be more than doubled in size under the country's 1962-67 Five-Year Plan, a new Cooperative Institute has been set up, assisted in part by a Foundation grant, to train such personnel and conduct research.

In a Foundation-aided extension effort aimed at the non-agricultural aspects of rural life, Syria's Ministry of Municipalities and Village Affairs has established a program to provide technical-service staffs for the *mukhtars* (mayors) of the country's 215 municipalities. The municipalities comprise more than 4,000 villages, in which two-

thirds of Syria's four-and-a-half million people live. More than 1,000 rural youths have been recruited and trained as mechanics to operate and maintain pure-water pumping systems, electricians to look after generators and power lines, surveyors and construction foremen to build roads and irrigation systems, and in other skills necessary to bring the benefits of twentieth-century life to village communities.

One of the most extraordinary rural-development projects in the Middle East is in one of the region's most unlikely places – the bleak, putty-colored Jordan Valley between Jericho and the Dead Sea, 1,300 feet below sea level. The project is concerned with one of the area's most distressing problems: the thousands of dispossessed Arab Palestinian families living in Jordanian refugee camps.

Convinced that this bitter land and hostile climate could be settled by some of these people, a middle-aged Palestinian lawyer named Musa Bey Alami ignored the advice of hydrological experts and began in the summer of 1949 to dig for water. Using hand tools, then an improvised, hand-operated drilling rig, the work proceeded for over five months. Then one day in January the cry went up – *moy!* water!

Today Musa Bey is still tirelessly at work on an effort that, after fourteen years, can show the following:

–One thousand acres of reclaimed land, shaded with cypress, pine, and palm and bearing citrus fruits, dates, olives, and papayas, as well as field and vegetable crops of all kinds: alfalfa, wheat, barley, tomatoes, lettuce, celery.

–A vocational boarding school enrolling 160 refugee orphan boys, with programs in agriculture, machine shop, and carpentry.

–A modern poultry farm (12,000 broilers, 5,000 layers, and 2,000 turkeys) that includes an egg-candling machine, processing and packing equipment, and deep-freeze storage rooms.

–A dairy herd of fifty-six black-and-white cows, heifers, and calves (equipment includes pasteurizer, creamery, ice-cream maker).

The farm has become a school to the entire Jericho region. With

techniques developed there, 40,000 nearby acres have been reclaimed and settled, many by refugee families. What was desert in 1950 is a flourishing island of green.

But agriculture in the extreme summers of the Jordan Valley demands ingenuity. Poultry, Musa Bey was told, could not survive such temperatures. Housed in coops with very high roofs, however, sprinkled with a hose from time to time, and fed with ice water, his flocks have done well. Dairying, too, was said to be unthinkable: sufficient forage could not be grown. Musa Bey thereupon introduced the area's first alfalfa, and he gets up to ten cuttings a year.

Much of the work on the farm is done by the boys in its vocational school. "We want them to leave here imbued with the pride that goes with being able to support themselves with their own hands," says Musa Bey. The boys enter the school as young as eight or nine, taking elementary-school work until they are ready for the four-year vocational course. Here they are first grounded in three trades – agriculture, machine shop, and carpentry – then required to specialize in one. Maximum responsibility is given the boys at each stage; they graduate knowing how to size up a job and do it well. One result: a waiting list of requests from as far away as Saudi Arabia for agricultural graduates to serve as farm managers.

Staffed by eighteen people, the farm-and-school project operates under the auspices of the Arab Development Society, of which Musa Bey Alami is founder and president. It has received Foundation support totaling $516,485 for agricultural specialists and equipment.

Another Arab Development Society project is a self-help program in the Jordanian villages along the frontier with Israel, many of which were cut off from their lands and wells by the 1949 truce line. "Life is so depressed among these people," says Leila Mudawar, project staff member, "that assistance with even the simplest things can make a difference. We have helped them start poultry flocks, raise bees, build cisterns, dig wells, and terrace their small holdings of land. For the women, we have classes in needlework, embroidery, and knitting, and

we sell their things in our shop in Jerusalem. This is only a fraction of what needs to be done, but it has brought hope to many communities where there was only despair." The village program has been assisted by a Foundation grant of $500,000.

The Role of Education

It has been said that to educate a man is to educate an individual, to educate a woman is to influence a civilization. And one of the most progressive facets of social change in the Middle East is the emergence of women from the tradition-bound seclusion of the past to a role in the shaping of the world about them.

"In the long run, a society can advance only as far as its women can advance," says Frances M. Gray, president of Beirut College for Women. "The women – in their role as mothers and teachers – establish the initial outlook of the young. If women have not experienced the possibilities of progress and do not feel their worth as individuals, the children of a nation will continue to be trapped in the patterns of the past."

Among the principal institutions assisting the rising status and contributions of women in Middle Eastern society is Miss Gray's – the Beirut College for Women. Occupying a shady, five-acre campus among the pastel-colored buildings of residential Beirut, it offers a four-year bachelor-of-arts program in nine major fields. Its enrollment of 420 includes young women from more than a dozen countries in the Middle East. Blending intellectual attainment with social service, the College stresses the liberal arts and conducts substantial programs in teacher education and home economics. Initiative and responsibility are fostered through such activities as the College-sponsored Neighborhood House (where students form the main staff of an elementary-school and case-work program for some 100 underprivileged children and their families); and an Arabic-language children's theater and a literacy project for the College's maids, cooks, and handymen.

Numbers of Beirut College alumnae have become elementary-school and home-economics teachers or school principals in the Middle East's expanding effort in the education of girls. Others are staffing public and private agencies concerned with orphanages, maternity clinics, homes for the aged, and other health and welfare institutions.

Faculty development, library improvement, dormitory construction, and home-economics expansion are among the ways the Ford Foundation has aided the College through grants of $666,400.*

Twenty-five miles north of Jerusalem lies Bir Zeit College, a cluster of cool, thick-walled buildings in a hilltop town of 5,000, which became a full-fledged junior-college institution in 1961. (In the Middle East, incidentally, the term "college" does not necessarily imply higher education.) As the pioneer coeducational institution in Jordan, about a fourth of Bir Zeit's 120 students are women. The College, whose development has been aided by $287,000 from the Foundation, has two main curricula. The first is arts and sciences, which Musa Nasir, president of the College, calls "a crucial transition from school to university study." The second curriculum is public administration and business, and its graduates enter government service or commercial and industrial firms. "This group is filling a tremendous need in a small country like Jordan where only a handful of its administrative personnel has had any higher education," says Nasir. This need was one of the reasons why King Hussein appointed a Royal Commission on Education (Musa Nasir was chairman; the Foundation provided the services of educational consultants) and recommended the founding of a Jordanian university, inaugurated in the fall of 1962.

Foundation assistance to higher education in Iraq includes $463,000 to help establish in 1956 the Al-Hikma University, and sup-

* Receiving increasing support from sources in the Middle East, the Beirut College for Women is an American-sponsored institution. Three similar regional institutions have received $3.6 million from the Foundation to strengthen their faculties and develop their educational programs. They are: the American University of Beirut, the American University in Cairo, and Robert College, Istanbul.

port to the central library of the University of Baghdad. Al-Hikma, built and staffed by American Jesuit Fathers, occupies neatly landscaped yellow-brick buildings in a suburb of Baghdad. It offers basic liberal-arts training and business and engineering specialization to more than 300 Iraqi men and women. The Foundation's assistance to the 30,000-volume University of Baghdad central library provided consultants and overseas training fellowships.

In teacher-training and secondary education, the Foundation's support has been characterized by the necessity of adapting teaching and learning to the needs of rural children.

Grants totaling $884,910 have been made for teacher-training colleges in Hawara, Jordan, and in Homs and Hama, Syria. For secondary-school development, four grants amounting to $400,000 have been made in Lebanon.

The emphasis in teacher-training is exemplified by the program of Hawara College, a two-year institution in a wheat-growing area of northern Jordan. Enrolling 300 young men, its academic work includes a solid injection of rural sociology; its pedagogical training requires extensive practice teaching in village schools. Students make weekly visits to villages to conduct literacy classes and to study health, agriculture, education, hygiene, housing, and other needs. "We are trying to create true community schools," explains Husni Fareez, Jordan's Under Secretary of Education. "The students at our teacher-training colleges are being prepared not only to serve village pupils, but also to serve as leaders in the community for social and economic progress. The teacher is the natural ally of the extension officer and others working to improve rural life."

Although most Middle Eastern villages are within reach of a grade school, the same is not true of secondary education. Most rural children are denied access to more than a grade-school education, unless they are lucky enough to be able to live with relatives in the nearest large town.

In Lebanon, a number of groups have sought to meet this problem by establishing high schools in the more remote regions of the country. Strengthening these schools is one of the purposes of the National Council for Secondary Education, a nongovernmental organization aided by a $200,000 Foundation grant. Also, three such secondary schools – Marj'oyoun National College, Shouf National College, and Bishmizzine High School – are attempting to develop as regional and national models of attainable quality, assisted by grants totaling another $200,000. There would be virtually no secondary education in their areas if they did not exist.

All three schools have built modern campuses with good labora-

tories and libraries. Coeducational, nonsectarian institutions attracting students from a wide area, they are hard-working places requiring from four to five hours of homework a night. The schools stress the teaching of English as a second language, an important key to a job and to success in college.

This points to another Foundation interest in education in the Arab states. At Baghdad College, a Jesuit-run secondary school in Iraq that is equipped with a new language laboratory, the Foundation is assisting a pilot project in English as a second language, which has developed a special series of texts. In Syria, funds have been provided for an intensified effort to improve English-language competence at the Universities of Aleppo and Damascus. In Egypt, support is being provided for books and equipment for the Ministry of Education's new Linguistic Unit – a group of Egyptian experts who are applying modern linguistic methods in upgrading the skills of English-language teachers and in preparing new materials.

Also in the Arab countries, the Foundation is cooperating with the University of Wisconsin in providing advisory and training services in the field of science education. In addition, Lebanon is receiving similar assistance in connection with her plans to expand technical and vocational education.

Modernization in Government and Business

Lebanon began a thorough overhaul of its public administration in 1959 with the establishment of a high-level Civil Service Board. One of the Board's principal activities is the Institute of Public Administration, which conducts an on-the-job training effort for about 300 civil servants a year in all ranks – from file clerks to top executives. With the probability of promotion as an incentive, participants attend four-month sessions three afternoons a week. A faculty of practicing administrators teaches courses ranging from filing systems and work simplification to job analysis and data processing. Helping to develop

curriculum and teaching materials are two Ford Foundation consultants: Roy Jumper, a North Carolinian with overseas technical-assistance experience in Saigon, and Raoul Grenier, a seasoned Canadian public-administration expert. With their assistance, Charles Rizk, director of studies, is initiating a full-time, two-year course for hand-picked master's-degree graduates who will be prepared for civil-service executive careers.

Among the stumbling blocks to improved government administration are inadequate census figures and data on such matters as national income and agricultural and industrial output. The Foundation has assisted efforts to obtain better statistical information and analysis both locally – in Jordan, for example, by helping set up a modern department of statistics – and regionally, by support to the International Statistical Education Center, in Beirut. The regional center is directed by Faiz Khuri, a former executive statistician for the World Health Organization. Since 1953, the Center has trained more than 300 statisticians from eighteen countries.

Faced with major decisions in long-range planning for development projects, the government of Jordan requested the Foundation to provide an advisory group to help train professional staff for its Development Board and work with the Board in formulating a national plan for 1962-67. Nine experts participated over a two-year period in studies and discussions which produced a detailed five-year program and helped establish the personnel-training and organizational procedures for carrying it out. Under the plan, Jordan has embarked on a national effort aimed at achieving a 60 per cent boost in Gross National Product and a substantial start in cutting her huge annual balance-of-payments deficit. Related to this effort is a fresh attack on one of the hardest problems of development economics – tax and fiscal reform. With the aid of Foundation consultants, a Royal Fiscal Commission developed recommendations that have resulted in basic improvements in Jordan's tax structure and budget management.

The recent inauguration in Saudi Arabia of national planning has

heightened the government's awareness of the need for building a modern public service. An extensive program of administrative reform and personnel-training is being undertaken; three senior advisers provided by the Foundation will assist the government in implementing the program and recruiting specialists in economics, finance, personnel development, and other fields.

Two regional centers that are promoting modern economies in the Middle East – the Economic Research Institute at the American University of Beirut, and the Industry Institute, also in Beirut – have received Foundation assistance of $586,000 and $300,000, respectively.

Test equipment (left) *at Industry Institute, Beirut, serves area's manufacturers.*

Below, *Charles Rizk, study director of Lebanon's civil-service training program.*

"The concept of research has only recently found expression in the Arab world," says Yusif Sayigh, Economic Research Institute director. "The pressure of day-to-day problems and the immense weight of immediate concerns have made research seem a luxury. Of course, exactly the opposite is the case – we would be working in the dark without it." The research efforts of Sayigh and his colleagues are shedding light on many timely questions – for instance, the scope and nature of Lebanon's national income, service industry, and balance of payments; the role and potential of tourism as a regional economic asset. The Institute has also undertaken a survey of the needs for economic education and research in the Arab-speaking countries.

The Industry Institute, started with United States Government assistance, has both an economic and scientific staff and is the Middle East's only independent industrial research and development organization. Like its Western counterparts, it is devoted to improving manufacturing processes and products and also provides management-survey, market-research, and other similar services. It places an array of modern industrial laboratories, test equipment, technical literature, and managerial know-how at the disposal of its users. A Lebanese foundry, for instance, was able to jump sales 25 per cent with testing and quality-control procedures set up by the Institute. Companies in Kuwait, Syria, Jordan, Saudi Arabia, and Iran have also been aided. It plans to double its present staff of thirty-five engineers, economists, and technicians in the next four years through a training program aided by the Foundation's grant.

30

Iran

Rural Reconstruction

In a plains area of northern Iran bordering the Caspian Sea and Soviet Russia live some 135,000 Turkoman farmers. One of the villages typical of the area is Dogonji, a small, mud-brick, thatched-roofed community of about 400. Here, in a tidy two-room cottage, lives Reza Hosseini, twenty-three, one of Dogonji's most respected citizens. Holding the title of dehyar (friend of the village), it is his task to serve the village in three ways: to promote understanding and use of technical services available from the government in agriculture, health, education, and other fields; to convey the village's needs and problems to the appropriate technical agencies; and, most important, to awaken within the village people a faith in their own power to overcome their legacy of ignorance and poverty.

Dehyar Hosseini's work has, in the span of a few years, put Dogonji in touch with progress. Streets and yards have been cleaned of rubbish, houses repaired and whitewashed, shade and fruit trees planted, sanitary latrines installed, and literacy classes started. Food production has been boosted through the use of a rust-resistant variety of wheat and the raising of garden crops like spinach, most of which were unknown to these recently settled, nomadic Turkomans.

Assisting Hosseini and other dehyars in the area is a woman dehyar, Mrs. Mahboobeh Erfanian, who concentrates on programs for women and girls. Lessons in cooking to improve diet, and classes in literacy, sewing, rug-weaving (an important Turkoman home industry), child care, sanitation, and health are among Mrs. Erfanian's tasks. "Teaching something as ordinary as washing and treating a child's cut has a very real effect on the quality of village life," she points out. "Infection and even tetanus are commonplace in villages not covered by the dehyar service."

Dongonji is in Iran's Gorgon-Dasht rural-development program, which includes both Turkoman and Fars (Persian-speaking) villages.

The villages are served by 138 dehyars specially trained to guide the reconstruction of village life. Because of Dehyar Hossein Golkar, for instance, the village of Ahangar-Mahaleh now has a spring-fed fresh-water supply and a rebuilt and enlarged school. Also, production of its honey-bee colony has doubled. And Oozineh, farther west, is now accessible in all seasons because Dehyar Gholam Boroumand spurred the rebuilding of its road. And its streets, once a sea of mud, have been ditched and drained.

Dehyars have also helped farmers establish credit cooperatives to keep them from the predatory grasp of money lenders; encouraged them to inoculate their poultry, sheep, and cattle; and trained them in the use of chemical fertilizers, improved seeds and tools, irrigation, and other practices. For technical assistance the dehyars rely on agricultural engineers, veterinarians, public-health officers, and other experts in Gorgon, the area's principal city. The dehyars are supervised and trained by a project staff of extension-methods experts, rural sociologists, and field officers.

Covering 338 villages representing three-fifths of the 320,000 people in an 11,400 square-mile region, Iran's Gorgon-Dasht project is one of the most comprehensive rural-development efforts in the Middle East. Its purpose is to demonstrate a feasible pattern for improving the economic and social conditions of the 80 per cent of Iran's twenty million people who live in villages. Following earlier support for rural-community experiments in Iran (particularly in the Varamin plains, near Tehran, where the first dehyar-training service was instituted), the Ford Foundation provided some $330,000 to help launch the Gorgon-Dasht effort. It also provided a rural-development specialist, Robert Smither, a native of Kentucky with a background in social anthropology, to work with the project's staff.

The project uses the "unit-system" or "group-interest" technique in raising farm output. Five farmers from the same village each agree to try out new methods on part of their land. They are given the full gamut of assistance – improved seed and fertilizer, for instance – on

the condition that they donate to five other farmers enough of their harvest to permit them to make similar plantings. This group, in turn, pledge themselves to assist a third group of five.

"The process seldom reaches the third stage," explains Vajihollah Asbaghi, a project field officer. "With ten good farmers using better methods and proud of their results, most of the others in the village are soon won over to following their practices."

The number of independent cultivators is expected to increase rapidly in Iran as a result of new land-reform efforts to break up feudal holdings and reconstruct rural life. Thus, agricultural education assumes added importance. With the help of two consultants provided by the Ford Foundation, the Pahlavi University Faculty of Agriculture, in Shiraz, southern Iran, has developed a teaching and research program dominated by a concern for the *users* of agricultural knowledge – the area's farmers. Studies are based on crops, soils, and animals of the region, and students help produce a regular series of agricultural-extension "how-to" bulletins. Also, primary emphasis is placed on training, demonstration, and experimental work at the University's 1,300-acre farm.

Projects in Education

"Of the 300 students we have graduated since we started in 1957," says Ali N. Khodabandeh, principal of Shiraz's Nemazee Vocational School, "75 per cent have jobs, mostly in trades for which they were trained, and another 5 per cent have gone on to college. The remaining 20 per cent are unemployed, which is not a large number when you consider that at least three-fourths of the graduates of other secondary education in Iran not going to college can't find jobs."

As Khodabandeh indicates, Iranian youth, like their counterparts elsewhere, are not easily absorbed by a modern-day labor force that sets a high premium on skilled personnel. Particularly difficult to develop in newly industrializing countries is a group capable of filling foreman and technical-assistant jobs, the essential link between the engineer and the semi-skilled worker. The preparation of this level of craftsman (to serve in industry or as teachers in Iran's expanding vocational system) is the purpose of the Nemazee School.

Housed in a capacious, skylighted building and resounding with the whirr of motors, the whine of bandsaws, and the tattoo of ham-

Villages in northern Iran are aided by extension workers (dehyars), one of whom is shown (opposite) *speaking to farmers. Pure-water cistern* (right) *was village project guided by dehyar.*

mers, it has well-equipped shops in six trades (machine shop, auto mechanics, electricity, plumbing, carpentry, and masonry). The school offers a three-year curriculum for each field. In the afternoon the school's 350 students shed their blue shop overalls for classroom work in mathematics, physics, chemistry, mechanical drawing, English, Persian, social studies, and other subjects.

Founded as a regular secondary school, it began its vocational emphasis in 1953. In addition to support from the Iran Foundation, of New York, and the government of Iran, it has been aided by $510,000 from the Ford Foundation, which underwrote the services of an American vocational-teacher team and financed teacher-training and shop equipment.

Two other educational projects supported by the Ford Foundation in Iran are intended to create two basic educational tools – a Persian dictionary and a one-volume Persian-language encyclopedia. "There is no standard, convenient dictionary in Persian," explains M. Minovi, editor of the dictionary. "Previous writers of dictionaries regarded a dictionary as a tool for a learned man, not as something the general reader, or even students, would want. Therefore previous dictionaries concentrated on the most abstruse and difficult words." To collect words that comprise the main body of the language, Minovi and his associates have gone to classical authors, who created modern Persian and in whose works the language reached its purest, richest form. Every principal word in thirty books ranging from Firdausi's epic, *Shahnameh*, to the lyrical writings of Hafiz will be extracted and illustrated by the sentence in which it was used. Descriptions and citations will be written for the 40,000 to 50,000 words expected in the finished product, with the direct, derived, and figurative meanings identified. "For some Persian words, this is a sizeable job," notes Minovi. "The word *ab*, meaning water, for instance, has nineteen direct meanings and 250 derivative and figurative expressions."

Compiling the Persian-language encyclopedia, too, is an exacting task. "The encyclopedias we have are not only hopelessly antiquated,"

says its editor, Hossein Mossaheb, "they are written in Arabic, which to the average student in this country is about as familiar as Latin is to students in the West." The completed work, expected in 1964, will contain about 40,000 items and will be about 2,000 pages long. Like the dictionary (target date: 1965), the project is being carried out under the direction of Franklin Publications.

Charting the Course

As a nation with a relatively large number of university graduates, many with training abroad, and with substantial economic resources, including oil, Iran's capabilities are strong.

In developing its industrial and rural potential, Iran has been trying to broaden understanding of the planning process and increase the number of competent planners.

The Ford Foundation provided $1,283,000 between 1958 and 1961 for the Economic Affairs Division of the Plan Organization – a research and training unit that worked on a comprehensive, national plan for 1962-68. In addition to overseas training fellowships, the Foundation's grant financed the services of specialists in economics, finance, agriculture, and transportation, who were recruited and supervised by the Development Advisory Service of Harvard University's Center for International Affairs. When in 1962 the Economic Affairs Division was assigned a relatively subordinate role in government decision-making, a number of the senior staff resigned. "Nevertheless," notes a former director of the Division, "the 1962-68 Plan constitutes Iran's first comprehensive national plan for coordinating such factors as monetary and financial policy with development activity." The Division also developed a group of professionally competent economic planners. But the long-term outcome will depend on how extensively planning is used as a guide to economic policy and on creation of an adequate organizational framework for implementation of plan objectives.

36

Turkey

The Path of Science

Kemal Atatürk, founder of modern Turkey, proclaimed, "The truest guide in life is science," and during his lifetime a genuine scientific community was born. But in the years following, talented young people turned to law, medicine, and other careers, and science languished. Recently, however, Turkey has recovered her early grasp on the vital connection between research and progress.

Among the leaders of the renascence of science are a group of men in their thirties and early forties who are establishing graduate programs in experimental and theoretical physics, mathematics, and chemistry at Middle East Technical University, Ankara. Their work is being aided by $600,600 from the Ford Foundation to finance staff training, interim services of visiting foreign professors, research equipment, and books.

The most conspicuous advantage held by the young group, however, is the climate of the University itself. Differing from most others in the Middle East, it is not a federation of autonomous faculties but a functionally coherent institution with a modern administration. Founded with United Nations aid in 1956, Middle East Technical University has begun an ambitious building program under the leadership of Kemal Kurdas, its president. By the fall of 1963, on a 11,000-acre tract four miles from Ankara (as large as the city itself), fifteen buildings had been pushed close to completion, accommodating 2,000 students in a spectrum of scientific, engineering, and managerial fields. Future plans envisage an academic community of 12,000 students and faculty members.

While the faculty carried on in make-shift quarters near the starkly modern facades of Turkey's national legislature, its science and mathematics departments moved forward with their research: Bahattin Baysal in polymer and radiochemistry; Vedat Enüstün in colloidal chemistry and statistical thermodynamics; Cengiz Uluçay

in the theory of functions; Adnan Saplakoglu in the use of radioisotopes in agricultural research, and Erdal Inönü and Feza Gürsey in elementary particles, general relativity, and reactor theory.

These are men who have served in leading research centers (California Institute of Technology, Argonne and Brookhaven National Laboratories) and worked with such scientists as I. I. Rabi of Columbia University and Princeton's Eugene Wigner. They are in a good position to select foreign colleagues to help them create a sound program of graduate teaching and research. With seventeen students in the first year of the program, they ultimately hope to have as strong a call on Turkey's ablest young minds as universities in the United States, Europe, and the Soviet Union.

They are also represented in a partnership between Turkish scientists and the country's Ministry of Education that has resulted in the establishment of a National Science Lise, or high school of science. Turkey's first program for the scientifically gifted, it will enroll about 300 students recruited through a nationwide competitive examination. The first class of 100 boys and girls is expected to begin the three-year course in the fall of 1964. The school will be a boarding institution on grounds donated by Middle East Technical University.

With the aid of a $1.1 million Foundation grant, a strenuous teacher-training and curriculum-development program for the school is under way, including the recruitment of thirty outstanding teachers through a national competitive examination; a year's intensive training in Ankara; a summer institute in the United States; then, with the opening of the school, a two-year period of forging modern curricula for Turkish students in mathematics, physics, biology, and chemistry.

The new Lise will have close links with the rest of Turkish education, since half of the thirty teachers will be assigned to other high schools in Ankara. Working with Turkish scientists and science teachers at each stage will be a group of scientists and science teachers from Florida State University and other American institutions.

A further step by Turkish scientists in stimulating improved

54

teaching in the schools is the publications program of the Turkish Society for Pure and Applied Mathematics. Begun with Foundation help in 1962, the program in its first year selected and translated into inexpensive Turkish editions more than fifteen works on modern developments in mathematics for use by high-school teachers and students.

Library and Language Problems

Turkey is in a better position than most Middle Eastern nations to create a modern library system, a weapon against ignorance as important as schools and teachers. With an established library-science program at Ankara University, she has the means to overcome the chief bottleneck – the dearth of professional librarians.

Now in its ninth year, with 200 students, the Institute of Librarianship is among the largest and most popular programs in Ankara's Faculty of Letters, in whose cumbrous, purple-stone building it is housed. Its demanding four-year academic syllabus includes training ranging from childrens' libraries to special collections in law, science, and other fields. As a condition for admission to the final examination, students must complete a thesis. Practical knowledge is injected through the requirement of 160 hours of on-the-job experience under a professional librarian.

Osman Ersoy, the Institute's University of Chicago-trained director, and his colleagues are also furthering Turkish librarianship by expanding the country's small body of literature in the field and by working with the Turkish Library Association and National Library in in-service training and other programs. To help the Institute develop, the Foundation provided $321,875 between 1954 and 1961 for the services of six library experts selected by the American Library Association and for overseas training fellowships for the Turkish staff.

Access to languages is another educational need for the less-developed countries. The vast knowledge accumulated by the West in

Language laboratory at Robert College, Turkey, illustrates use of modern electronic aids to speed training in English as a second language.

science, agriculture, economics, and other fields is under the lock and key of tongues strange to the developing nations, and – short of massive, costly translation programs – command of at least one Western language is essential. As reflected in Foundation-aided efforts in Egypt, Iraq, Syria, and Tunisia (see page 44), English as a second language has emerged as a preferred choice in the Middle East.

Robert College, on a hillside overlooking the Bosporus just outside Istanbul, is using the once esoteric science of linguistics, together with modern electronic devices (a language laboratory), to speed acquisition of English. With assistance from the Foundation, it has set up an English Language Division to prepare students for its two component sections – a high school and a college, both of which are taught largely in English.

Backbone of the Division's one-year course is a sequence of exercises prepared by Sheldon Wise, a tall, sandy-haired, Yale-trained linguist. "The exercises stress repetition of phrases and sentences that establish the normal usage of words," explains Wise. "The purpose is to build up an automatic response to grammatical patterns. It is the pattern of use – not the rule for it – that matters."

On the other hand, Wise does not bypass grammar or the stu-

dent's native language. "The source of many of the student's problems is in his own language, not in the one he is learning," he says. For example, the Turkish ear does not easily distinguish a vowel between a group of consonants. The verb form *stirring* may become the noun *string*. ("The sugar won't dissolve in the coffee without string.")

Technology and Management

No less than in cities like Cairo, Beirut, or Tehran, the traffic swarming beneath Istanbul's minarets, and the humming factories rising in its environs, symbolize the noisy advent of the industrial age in the Middle East. Like Egypt, Turkey, too, is launching a new profession – skilled enterprise management – in the face of a tradition that has favored careers like soldiering, law, engineering, and medicine. Since it started in 1954, Istanbul University's Institute of Business Administration has established a solid beachhead. With more than 600 graduates of two programs – a nine-month certificate course for new university graduates, and a three-month in-service course for experienced middle managers – it has won recognition by the business community. Not only does it receive financial aid from seventy-five industrial sponsors, but top managers pick their best men for the middle-management course, continue to pay their salaries, and contribute to the cost of their training.

Both Institute programs cover production, human relations, marketing, cost accounting, and business policy. Instruction adheres strictly to the case-method approach, reflecting the training of the faculty, most of whom – with Foundation assistance – attended the Harvard Graduate School of Business Administration. Foundation grants, which total more than $1 million from 1954 to 1962, also provided a series of Harvard professors as resident advisers.

The director of the Institute is Mehmet Oluç, an economist who has done advanced work in business at three American graduate schools. He is proud not only of the Institute's value to its graduates

(alumni of the middle-management program earn on the average twice as much as their contemporaries who have not had their training), but also of the Institute as a research center. Its study of the Bursa province was the first regional economic survey in Turkey, and has brought requests from other provinces for similar projects.

Top management's growing responsibility is exemplified by two new organizations in Turkey — a Turkish Management Association and an Economic and Social Studies Conference Board. In the latter, which grew out of a Foundation-aided meeting in 1959 on international law and development, business executives are participating with government and academic figures in a national forum to improve understanding of problems of development. "It is unusual in Turkey for leaders from all sectors to come together to explore important issues dispassionately and objectively," observes Nejat Eczacibasi, a leading Turkish industrialist and Conference Board president. "The program is giving us all a spirit of mutual confidence and purpose."

Because a variety of associations for management training and research on business are emerging, the Foundation has assigned a full-time specialist on business management in Turkey to work with them on objectives and organization.

Drug manufacturer visits one of his laboratories. Advanced business training is a feature of Turkish national development.

Tunisia and Algeria

The Cultural Base

During the bleak centuries when Europe groped through its dark age until well into the medieval period, the Middle East attained one of the most brilliant cultures of civilization. In poetry, philosophy, history, mathematics, astronomy, architecture, and medicine, the region's scientists, scholars, and artists built a monumental heritage. It is a matter of some irony, therefore, that this rich cultural tradition should also cast up a bewildering dilemma: how to retain the teachings of the past and still press forward to build a modern society.

This is the context of a new institution in Tunisia – an International Cultural Center that opened in 1962 with the aid of a $71,000 grant from the Ford Foundation. Located in the beautiful seacoast town of Hammamet some forty miles from Tunis, the Center is bringing together leaders of thought from throughout the Middle East to consider – with Asian, African, and Western thinkers – the region's cultural needs.

Individual artists and scholars are invited to use the Center. In an exquisite setting, with ten acres of gardens, three cottages, and a main building whose cool, colonnaded porch overlooks the sea, the Center affords serenity and quiet for creativity and thought.

"We hope that here we can keep open the windows of the Arab mind," says its director, Cecil Hourani, former professor of political science, who is special adviser to President Bourguiba. "We need to look outward and inward – to enlarge our vision of the international community and to look at ourselves and our civilization, at what we were and are and hope to become."

Research and Training

Systematic study of Tunisia and her four million people – the impact

of social change and the potential for development – is the task of scholars at the University of Tunis' Center for Economic and Social Research, which has received $100,000 in Foundation support. Housed in a refurbished apartment building in an old market quarter of Tunis, the research center comprises two groups of social scientists and student assistants – one in sociology, the other in economics. They are gathering data and making analyses on such questions as change in traditional attitudes, social mobility, the structure of commerce, and underemployment.

Concerned that population pressures may seriously impede the nation's ability to advance living standards, the government of Tunisia in 1963 requested Foundation assistance for an experiment in family planning. The Ministry of Health, with the help of a $200,000 grant, is establishing in twelve Maternal and Child Health Centers a program to further the understanding and practice of family limitation. Medical records will be kept to determine which procedures work best among various parts of the population. Results of the experiment will provide the basis for a subsequent, expanded program.

Research on economic-policy problems (savings, investment, price policies, regional development) is being conducted by the country's Ministry of Planning and Finance, assisted by a senior economist, Professor Torsten Gardlund, of Stockholm University, whose consulting services were provided by the Foundation.

Meanwhile, Tunisia, like other new nations, has found the day-to-day affairs of government and business hampered by lack of trained office staff, and has therefore established, in Tunis, a Secretarial and Accountancy School. Operating on an intensive, double-shift schedule, the school opened in 1962 with some 100 future accountants, office managers, and administrative secretaries enrolled. The Tunisian government, which initiated the school with the help of $60,000 from the Foundation, underwrites the students' education on the condition that they agree to take jobs during a five-year period wherever they are needed in the country.

Future office staff of Tunisia's government and business are trained in new school.

Cultural center, Hammamet, Tunisia, is international meeting and working place for artists and leaders of thought.

For another new educational effort in Tunisia, English-language training, the Foundation provided $156,000 to expand the teacher-training capacity of the Bourguiba Institute of Languages. Although the country has long had a second language – French – its leadership is anxious to strengthen access to the knowledge, ideas, and people of the English-speaking world, and it has made English a required subject in secondary schools.

The Foundation's assistance is underwriting an instructional program at the Institute which introduces working teachers to linguistic methods and tape recorders and other electronic equipment

used in language teaching. The program was started by Cornell linguist Robert A. Hall and is being continued by Richard M. Payne, who has taught languages at Stanford and Louisiana State. Later, the Institute expects to train new teachers in modern techniques in cooperation with the country's teacher-education centers. Since most English-language instructors at these centers are French, the task is complex: to improve the ability of French-speaking teachers to impart the English tongue to students whose native language is Arabic. The long-term solution, obviously, is to train Tunisians as English-language teachers, and the Foundation's grant provides overseas fellowships to make a start in this direction.

In neighboring Algeria, the latest Middle Eastern nation to secure its independence, the Foundation is helping enlarge the country's pool of educated leadership through scholarships for Algerian students studying abroad. This assistance began during the war with France, when $210,000 was given to help Algerian students who had to leave French universities for other European universities. In 1963, a further grant—$144,000—was made for scholarship aid to Algerians completing their education in Tunisia.

Pressing immediate needs for trained personnel in Algeria are being assisted through two recent grants. In Algiers and Oran, with the help of $88,300 from the Foundation, accelerated courses have been initiated to prepare qualified secretaries and accountants. And in Miliana, near Algiers, a $19,000 grant is aiding a training program for foremen and technical instructors in mining.

Israel

The Quest and Use of Water

For eight centuries following its settlement by the Nabataens in 200 B.C. the acropolis city of Avdat – now a ruin deep in the heart of Israel's bleak, windy Negev desert – supported a thriving population. The area's rainfall today is the same as it was 2,000 years ago – a meager four inches annually. Hence this mystery: how did the ancients maintain their civilization in this barren terrain?

In 1951, under the direction of botany professor Michael Evenari, a team of scientists from Jerusalem's Hebrew University went to the Negev to explore the riddle. By 1959, they had pieced together the answer. The ancients practiced "run-off" agriculture. Networks of channels in the hillsides formed "catchments" to lead rain water into low-walled, terraced fields on the valley floors. Because the fine, powdery soil (*loess*) formed a hard crust as soon as it was wet by rain, the run-off rate was exceptionally high. Captured in the terraces below the slopes, the water soaked three to four feet deep into the thick, wind-deposited layers of soil there. A few good rains – even one – were sufficient to support agriculture.

But Evenari and his group were concerned with more than an archaeological phenomenon. The Negev desert composes more than half of the state of Israel. Could the techniques of the ancient farmers open the way for modern settlers? To find the answer, two farms modeled on those of early times have been constructed – one in Avdat, the other in nearby Shivta. Fruit trees, pasture plants, cereal crops, and a variety of vegetables are being grown. Whether run-off agriculture is economically feasible for the Negev on a large scale depends on more data, although Evenari believes the prospects are promising.

Israel is searching for all possible means to make the maximum use of available water. Since the nation's water resources are already 90 per cent exploited, scientists are turning to the question of how saline water, found underground in relatively large quantities, might

be made useable. At the Negev Institute for Arid Zone Research, located in the booming, dusty city of Beersheba, a small pilot plant has been designed for desalinization of brackish water. As the water passes between chemically treated plastic membranes, sodium ions are drawn off on one side and chlorine ions on the other, leaving the water fresh as it flows from the end of the membranes. "Because it takes out the salt and leaves the water, which is the reverse of conventional methods," explains Institute director Joel Schechter, "the system requires a good deal less energy for brackish water conversion than other systems. The Negev has an estimated 100 million cubic meters of underground water now too saline to use, so the system's potential impact is enormous."

Two other devices concerned with water use – a compact, solar-powered turbine motor and a perfected sprinkler – are being developed respectively by Harry Zvi Tabor, at Hebrew University, and A. de Leeuw, at Technion (Israel Institute of Technology), Haifa. The first, a sealed, maintenance-free unit using chlorobenzine instead of steam (much higher energy-conversion efficiency for small units), will provide a cheap, handy power-source for pumping irrigation water. In the project to improve sprinkler systems (already the most efficient means of irrigation) designs are being sought that extend sprinkling distance, yet don't produce droplets of such size and velocity that, on striking the soil, they compact it and cut down water penetration. In Israel, literally every drop of water must count.

To improve ways of husbanding rainfall, Ahron Nir, of the Weizmann Institute of Science, Rehovoth, is doing research on aquifers, water-bearing layers of rock. After the underground supply contained in the aquifer has been used up, and the wells drilled into it have gone dry, the rock layer can be artificially recharged by pumping water back into it through the well holes. Thus the aquifer becomes a large underground tank for storing rainy-season water for later use. By the use of radioisotopes, Nir is developing new measurements essential to the accurate management of these rock-stored supplies.

These projects in water resources are but a sampling of the 149 scientific-research efforts in Israel in many fields that have been supported by the Ford Foundation. The purpose of this assistance, which totals $2,496,650 since 1953, is to help Israel make the best use of her substantial corps of trained scientists in the development of her limited natural resources. The projects are evaluated and recommended to the Foundation by the Israel Foundations Trustees, an organization of scientists and educators drawn from the country's major research institutions.

Scientist examines fruit tree grown in Negev desert by use of ancient principles.

Israeli device collects sun's energy and converts it to power irrigation pump.

Salt and Survival

A number of the Foundation-aided research projects in Israel deal with agriculture. The prospect that the country will have to farm with increasingly brackish water has attracted many scientists to the problem of raising the salt tolerance of basic crops. Some investigators have been probing the enigma of how desert plants manage to survive devastating extremes of salt and dryness. One finding: desert plants have a built-in "rain gauge." A water-soluble chemical substance in the seed coating acts as a germination inhibitor. Only when there is enough rainfall to remove the inhibitor completely will the seed germinate. Otherwise the plant would die overnight.

The mechanisms of how drought-resistant plants grow, use their water, resist salinity, and take up minerals are being explored by botanist Dov Koller, of Hebrew University. Eschewing the greenhouse approach, he has gone to the desert itself to study the plants. He works from a mobile laboratory – a small trailer equipped with devices that can be attached to the plant to measure such factors as carbon dioxide intake and water transmission. "The data we are getting on plants in their natural, undisturbed state have an order of reliability never obtained before," Koller says. "If we can find out precisely how desert plants succeed, then we will know the requirements for adapting agricultural plants to these extreme conditions."

Besides such basic research, applied research on arid-zone agriculture is also under way. A group at the agricultural institute at Beit-Dagon is conducting root-stock and grafting experiments in growing vines and fruit trees in saline water; developing a wilt-resistant tomato; and experimenting with rust-resistant strains of wheat by breeding with wild species native to the area. A young geneticist at Hebrew University is working on a variety of pond-raised carp – a principal protein source – hardy enough to thrive in brackish water; and a bacteriologist at the University's medical school is striving to control toxic algae that wipe out entire ponds of fish.

The Ford Foundation's program in the Middle East, now in its thirteenth year, has provided modest expenditures for development, compared with the outlays by these countries themselves and by technical-assistance agencies of foreign governments. The Foundation's purpose has been to make meaningful and lasting contributions by helping to prepare the skilled manpower for strategic, high-priority activities it has been asked to assist.

In the words of F. F. Hill, vice president responsible for the Foundation's Overseas Development program: "If a country is to develop, it must develop its people and its institutions. This is a difficult, long-term job that requires decades and even generations. If we are to assist, it requires people who have an understanding of the development process and the understanding and patience which come only from a firm belief in what one is doing and a heartfelt interest in the welfare of the people in the country where one is working."

A Progress Report on Area Vocational-Technical School Developments to June 30, 1966.

Pennsylvania State Dept. of Public Instruction, Harrisburg
MF AVAILABLE IN VT-ERIC SET.
Pub Date - Sep66 14p.

*AREA VOCATIONAL SCHOOLS; *FACILITIES; COURSES; HIGH SCHOOL STUDENTS; *ATTENDANCE; *PROGRAM DEVELOPMENT
PENNSYLVANIA

This brochure reports the progress in the development of area vocational-technical school programs within the state. An attendance area should have enough school districts to maintain a minimum of ten shop-laboratory activities and a senior high school pupil enrollment of about 2,500. A total of 74 attendance areas have been approved covering 55 counties. The average enrollment per attendance area is 5,100 pupils. Twelve counties were not served by approved attendance areas. Educational program plans are prepared by the local director of vocational education to justify program size and course offerings. Thirty-one plans have been approved. The average pupil size of school is 815 pupils and average number of course offerings is 20. As 24 to 30 months are required to plan a program and construct a building facility, construction of building was limited for the 2-year period, but 11 area school building projects were under construction. Seventeen programs were in operation and 27 more have planned school opening dates of September 1968 or before. (MM)

PREFACE

The rapidly increasing complexity of business and industry operation has brought to the attention of local, State, and National leadership the need to provide a comprehensive program of Vocational Education as a part of the educational system.

State and local leaders throughout the Commonwealth have been meeting this challenge through enabling legislation, encouraging the organization, establishment and operation of area vocational-technical schools on a regional basis.

This brochure gives a report on the progress in the Commonwealth in the development of area vocational-technical school programs from the initial stage of attendance area development to the construction of building facilities.

THE ATTENDANCE AREAS

The area vocational-technical school is an educational institution offering programs in one or all phases of vocational education on a technical, skilled, and occupational levels of instruction to secondary school pupils and out-of-school youth and adults in a geographical area comprised and operated on a cooperative basis by several school administrative units.

The basic purpose of the area technical school is to make vocational education available to all pupils of the Commonwealth by the establishment of programs to serve secondary schools in a given geographical area known as attendance areas. Attendance areas, therefore, outline the geographical boundaries of school districts and pupils to be served by an area vocational-technical school.

County Boards of School Directors have been delegated the responsibility to plan, prepare, and submit to the Department of Public Instruction proposals for arranging all school districts of the county into one or more attendance areas. These proposals are developed in counsel with school administrators, industrial, labor, and lay representatives of the area.

An attendance area school should have sufficient number of school districts to maintain a minimum of ten shop/laboratory activities. This requires a senior high school pupil enrollment of approximately 2500 pupils. Factors considered in planning areas include pupil population, community interest, facility of transportation, financial ability, organization of school districts, characteristics of school districts, etc. Attendance areas must be approved by the Department of Public Instruction and the State Board for Vocational Education before proceeding with the establishment of a school in the area.

APPROVED ATTENDANCE AREAS

ATTENDANCE AREAS APPROVED PRIOR TO ACT 463

No. Areas	Area	Approval Date
1	Fayette County	
1	Wyoming Valley	
1	Carbon County	11-57
1	Bucks County	2-58
1	Forbes Trail	6-59
1	Upper Bucks County	6-61
1	Northumberland	9-62
1	Central Westmoreland	5-63
1	Steel Valley	5-63

CHARACTERISTICS OF APPROVED ATTENDANCE AREAS

1. A total of seventy-four (74) have been approved including those areas having schools in operation, covering fifty-five (55) counties.

2. Sixty-five (65) attendance areas have been approved since February 1964, under Act 463.

3. Fifteen (15) counties have more than one attendance area:

Allegheny (4)	Luzerne (3)	Westmoreland (2)
Montgomery (4)	Bucks (3)	Schuylkill (2)
Delaware (3)	Northumberland (2)	Chester (2)
Berks (3)	Northampton (2)	Cambria (2)
Lancaster (3)	Washington (2)	Fayette (2)

4. Seven (7) attendance areas involve major portions of more than one county:

Columbia-Montour	Venango-Crawford-Forest
Juniata-Mifflin	Snyder-Union-Northumberland
Cumberland-Perry	Cameron-Elk
Clarion-Forest	

5. Ten (10) attendance areas are below the minimum standard of 2500 pupil enrollment.

   Greene, Bedford, Warren, Clarion-Forest, Upper Bucks, Clinton, Monroe, Huntingdon, Cameron-Elk, Fayette #2

6. The average senior high enrollment per attendance area is 5100 pupils.

COUNTIES AND PUPILS NOT SERVED BY APPROVED ATTENDANCE AREAS

County	Estimated Senior High Enrollment
Adams	1,947
Beaver	10,143
Blair	3,520
Butler	5,896
Fulton	548
Pike	282
Potter	867
Sullivan	288
Susquehanna	1,876
Tioga	1,854
Wayne	999
Wyoming	866
Total	29,086

EDUCATIONAL PROGRAM PLANS

The basic purpose of educational program plans is to prepare and justify program size and course offerings. The educational program plan is developed by the local Director of Vocational Education in cooperation with the professional and general advisory committees and field Supervisors of Vocational Education. Preliminary draft plans are reviewed, revised, and presented to the Department of Public Instruction for review and approval of a curriculum committee. The educational plan is used as a basis for drafting a room schedule in preparation for planning a building facility.

Summary of Facts Concerning Educational Plans

1. Total number of educational program plans approved is thirty-one (31).

2. Sixteen (16) of these programs are located in the Eastern Region of the Commonwealth, seven (7) in the West, and eight (8) in the Central.

3. Twenty-seven (27) programs are County Board operated and four (4) Joint Board.

4. Six (6) programs are being planned as full-time schools and twenty-five (25) as part-time service centers providing only the shop/laboratory phase of the program.

5. The average pupil size of school is approximately 815 pupils.

6. The average number of course offerings is twenty (20).

7. The average percentage of proposed enrollment of technical school pupils to total enrollment of senior high school pupil in the participating districts is 15.8.

BUILDING CONSTRUCTION

Planning and construction of building facilities evolves from the preliminary steps of planning an attendance area, development of an operating administrative organization for the school, planning an educational program, and planning and constructing a building facility. Since twenty-four (24) to thirty (30) months is required to plan an educational program and construct a building facility, the actual construction of buildings was limited in the past two (2) years. An extensive building construction program will develop in fiscal year 1966-67 as indicated on page 9.

Buildings Constructed and Funded

During the two (2) fiscal years, 1964-65 and 1965-66, eleven (11) area vocational-technical school building projects were under construction. The total cost of the eleven schools represents an expenditure of approximately $27,000,000 for building and equipment. The Federal allocation of funds to these building projects amounted to $4,560,000.00.

	Type School	Pupil Capacity	Equipment Cost	Const. Contract Awarded	Total Cost of Project	% Cost Eligible For Reimb.	Allocation Federal Funds: Vocational Ed. Act of 1963	Allocation Federal Funds: Appalachian Regional Dev. Act

*Expansion of facility

PROJECTED BUILDING CONSTRUCTION PROJECTS

The following attendance areas have planned educational programs for the number of courses indicated and are at various stages of planning a building facility. Since a minimum of one year is required to construct a building, those areas awarding construction contracts by September 1966 will be in a position to begin program operation by September 1967.

OHIO

The purpose of this publication is to provide school counselors with meaningful information about technical education programs which are sponsored by Ohio public schools. It is not intended for direct use by students. Information is given for 12 post-secondary schools in a standard format under these headings: (1) school address, (2) descriptive enrollment and housing information, (3) financial information, (4) general admissions requirements, (5) admissions procedures, (6) curricula offered, (7) 1965 freshman profile, and (8) 1965 graduate employment follow-up data. FOREWORD

The advancement of science and technology has created a demand for more technicians. This need is being met, in part, by post high school technical education. These two-year programs are designed to prepare high school graduates for employment as technicians in a variety of industries and businesses.

The purpose of this publication is to assist school counselors to obtain meaningful information about the technical programs in Ohio which are sponsored by public schools. The counselor is reminded that this publication is not intended for direct use by students, but rather, for counselor use in facilitating student decisions about education beyond high school. This practice should be closely adhered to in order to eliminate any misuse or misinterpretation of this information. This notebook includes many of the features of the Ohio College Notebook so that the two may be used together as resource tools.

Appreciation is extended to the directors of all of the technical schools for their cooperation in providing the needed information about their programs to prepare this revised edition. Also, supervisory staff members of the Division of Vocational Education, State Department of Education have provided their support, in the preparation of this edition.

This publication is a service of the Division of Guidance and Testing, State Department of Education. It has been prepared by the Guidance Services Section under the supervision of Sam Angus, District Guidance Supervisor for North Central Ohio and is based on the developmental and organizational work done for the first edition under the leadership of H. Eugene Wysong of the Test Program Section.

POST HIGH SCHOOL TECHNICAL EDUCATION IN OHIO

Opportunities for technical education have increased significantly in Ohio during the past few years due to post high school technical programs established through the assistance and coordination of the State of Ohio Department of Education and public school systems. With the passage of the National Defense Education Act of 1958, funds were made available under Title VIII to assist with the development of post high school technical education programs. Minimum standards for these technical education programs were established by the State Board of Education. The technical schools included in this publication are administered locally by boards of education and supervised by a person appointed by the board of education, who meets the qualifications established by the State Board of Education. Supervision for the maintenance of minimum standards and leadership for program development and improvement is provided at the state level by personnel in the Trade and Industrial Education and Business Education Services, Division of Vocational Education, State Department of Education. A state advisory committee with membership from business and industry provide advice and counsel to the Division of Vocational Education concerning program development and improvement. In addition to the technical programs administered by public school systems, school counselors also should seek information about the good technical programs operated by other institutions.

The two-year post high school technical programs are designed to prepare technicians to occupy para-professional occupations. Persons in such occupations work in team relationship with engineers or other professional persons, supporting the professional person in activities involving design, development, testing, management or marketing. The technician is a person who has a high degree of "know why" as well as "know how". A conservative estimate indicates that for every engineer, three to five technicians are needed. Depending upon the technical area of work the technician may use specialized measuring devices; build special machinery to test new devices; design electrical circuits, tools or machinery; program and operate computing systems; or perform supervisory, sales, or liaison duties in which technical knowledge is important. Both men and women are eligible for technical occupations.

The technical schools included in this publication will offer a curriculum for the education of technicians which will include approximately the following percentages of instructional time:

A. Fifty percent in mathematics, science, and technical laboratories.
B. Twenty percent in communications and leadership subjects.
C. Fifteen percent in basic manipulative skills.
D. Fifteen percent in any of the above areas or social sciences.

General Description of Technicians Being Educated in Ohio Technical Programs

Accounting Technician applies principles of accounting to install and maintain operation of the general accounting system. He may specialize in budget, cost, machine processing, or tax accounting aspiring to supervisory or managerial positions. The program is a two-year sequence of accounting and communication courses with laboratory experience using mechanical and electrical machines.

Agri-Business Technician may serve as a specialist in grading, processing, and marketing of grain; horticulture production and marketing; nursery production sales and service; agricultural machinery and services; or farm credit and management. These individuals may be trained to serve as specialists who would deal with farmers. They may study the purchase and use of materials and equipment and make recommendations to farmers. They may be employed in elevators or feed and farm stores.

Agricultural Equipment Technician will select, demonstrate, install, and maintain agricultural equipment and will have the ability to utilize technical bulletins and manuals related to the agricultural equipment and mechanics industry. He will have the understanding of the principles of business organization, management, and agricultural economics applicable to the business. Opportunities for employment will include farm equipment sales and service, farmstead mechanization, retail and wholesale salesman, foreman and supervisor, and management positions. Generally, the technician will be supervising or directing the work of others.

Architectural Drafting Technician this course of study applies to the building industry. The technician works with engineers and architects in the drawing and designing of buildings. The work is concerned with the drafting room in particular, but could lead to work in the field such as inspection and supervision on construction sites.

Chemical Technician works with chemists and chemical engineers in the development, production, sale, and utilization of chemical products and equipment. They may help to conduct chemical experiments by making tests or by computing, compiling, and analyzing results. In testing work, technicians may make chemical tests to determine if particular substances are present and in what quantities.

Civil Engineering Technicians may assist civil engineers in the design, layout, and construction of streets, sewage and water systems, and other municipal facilities. They may conduct and prepare studies of traffic control and building construction growth. They may test materials, conduct surveys, inspect materials, survey land, prepare maps, and subdivide land.

Data Processing and Computer Technician may be the programmer who prepares the detailed instructions which are needed to direct the computer's operations. The programmer usually starts the job by conferring with professional staff members who are in a position to furnish detailed information about the problem. The technician then makes a flow chart, or diagram, showing the order in which the computer must perform each operation. Detailed instructions are prepared for each operation which are transferred to the computer's memory and which tell the machine exactly what to do with all of the facts and figures associated with the problem.

Electrical Technician may work with electrical engineers in the designing, testing, and modification of new electrical equipment or products. They may prepare plans and diagrams for the wiring of electrical machinery and control circuits. They may sell electrical equipment or work in operation control of power stations and distribution systems.

Electronics Technician works in the field of communication electronics. They may assist the electronic engineer in such activities as the operation of electronic equipment, design and development of electronic products, and in production processes related to electronics. Their activities may be directly related to radio or television communications. They may sell electronics equipment or be field consultants to customers.

Food Distribution Technician program involves supervised training on-the-job with a supermarket firm as well as classroom work. The student enrolled in this program, will be trained to assume various jobs of responsibility in the supermarket industries after graduation.

Food Processing Technician program provides semi-professional training related to testing, computation and analysis in the laboratory. The technician understands the operation and maintenance of food processing equipment and he learns the procedures for conducting quality control studies. Supervision of others is an essential responsibility.

Food Service Technician program is open to both men and women who have interest and aptitude in managing food service facilities. It is designed for the student preparing for supervisory and managerial positions in the several areas of food service.

Industrial Technician may make statistical studies and analyses of production costs, periodically check a product's conformity to specifications, devise ways of improving tool and machine efficiency or determine wage incentives. They may be concerned with plant location, equipment layout, control methods, materials handling, or job evaluation. Production improvement is his prime concern.

Mechanical Technician may perform work in the fields of tool designing, machine designing, technical selling, or laboratory testing. They may originate and prepare sketches for tools, jigs, dies or other attachments used in machine operation. When planning and carrying out tests of performance, durability, and efficiency on experimental engines and equipment, the technician is often required to use testing apparatus, to prepare and interpret drawings, and to write reports.

Metallurgical Technician program includes courses designed to prepare the individual to work in the metals industry. After completing courses in basic and advanced theory as well as practical experience, the graduate of this program is qualified to enter such positions as foundry lab technician, metallurgical research technician, and metallurgical assistant.

Nursing Technician program involves preparation for the Associate Degree in Nursing. Classroom instruction and supervised patient care are included in the program preparing the technician for employment in any of the nursing fields. Upon successful completion of the program, the graduate may take the Registered Nurse State Board Examination.

Retail Technician program is designed to train high school graduates for retail supervision and managerial positions in areas such as advertising, display selling, and personnel relations.

Secretarial Science program includes such activities as scheduling appointments, taking dictation, typing, filing, and general office work and supervision. Specialization is possible to qualify for positions in medical, legal, or technical fields.

Wholesale Management Technician may perform work related to such activities as business administration, marketing, business economics, selling, advertising, and personnel management. It is a two year program that combines classroom instruction and on-the-job training to educate students for mid-management positions in the wholesaling of such diversified products as groceries, candy, toys, drugs, heating and air conditioning equipment electronics, paper products, sports goods, shoes, lumber, service supplies, and others.

MESSAGE

The purpose of this handbook is to assist guidance personnel in acquiring a better understanding of the curriculum and facilities available to youth and adults at Columbus Tech, and to aid them in counseling with youth and adults seeking a better future through technical and industrial training.

In order to be of value to guidance personnel, the school has also published brochures and will publish a catalog explaining in more detail school policies and curriculem offerings.

Questions

FOREWORD

Columbus Tech is located at 4460 River Road with Branch #1 facilities located on Courtland Avenue at Forest Road. The Central Admission Office is located at 4460 River Road. The school was established through the joint efforts of the Muscogee County School District Board of Education and the Division of Vocational Education of the Georgia State Department of Education. The school is operated as part of the total educational program of the Muscogee County School District.

The building was designed specifically as an Area Vocational-Technical School. It is modern and up-to-date in all respects including equipment is kept current with the changes and demands of business and industry.

Columbus Tech is one of a network of area technical schools established for the purpose of rendering an educational service to youths and adults in counties with a commuting distance of Columbus. However, persons living outside this area or in another state who meet the requirements for admission will be welcomed as students. Out-of-state students are charged an additional fee.

No dormitory or boarding facilities are available in the area vocational-technical schools. Students desiring living accommodations will be assisted in locating satisfactory quarters in Columbus.

Transportation to and from school will be the responsibility of each individual student.

The purposes of the school are to:

1. Make vocational and technical training, on an institutional basis, available to every youth and adult especially to those who do not plan to attend a college or university.

2. To develop in students manipulative skills, technical knowledge and the ability to interpret and use this knowledge in successful and gainful employment as technicians, craftsmen, or service personnel in business and industry.

3. To upgrade and improve the status of employed personnel and retrain those employed in occupations declining in demand due to the ever-present technological changes in our economy.

4. To make available to businesses and industry a continuing supply of technically trained, productive employees, thereby increasing individual earning potential and the industrial economy of the area.

5. To develop understandings, appreciations, personal interests and satisfactions, essential to the assumptions of civic, home and community responsibility.

The school will be operated as an educational service with course offerings modified, adapted and geared to the business and industrial needs of the area to be served.

STEPS TO GAIN ADMISSION TO COLUMBUS AREA VOCATIONAL-TECHNICAL SCHOOL

1. Submit an application for admission form to:

   Director of Admissions
   Columbus Area Vocational-Technical School
   4460 River Road
   Columbus, Georgia 31904

   This form may be obtained from the area school or your high school counselor. To insure prompt action on applications for the September term, you are encouraged to apply early, at least by the preceding January.

2. Submit an official transcript of high school work. The applicant should request his present for former school to send a transcript to Columbus Tech.

3. Report to the school for the Entrance Aptitude Test on the date and time assigned to you by the Admissions Office.

4. Send a small recent photograph of yourself to the school.

5. As soon as possible after the aptitude test arrange for personal interview with the assistant director or counselor.

6. Have your physician give you a medical examination. Form for medical examination will be mailed to you with your acceptance letter. The acceptance letter and medical form will be sent when you have completed requirements 1 thru 5.

SUGGESTED HIGH SCHOOL COURSES FOR ENTRANCE INTO VOCATIONAL-TECHNICAL SCHOOL

English	-	4 Units
Math	-	2 Units
Science	-	2 Units
History	-	2 Units
Typing	-	1 Unit
		11
Electives		7
TOTAL		18

For technical programs two years of algebra and one year of physics are desirable. Other science and math electives would also be helpful.

For business education programs general math, business math, accounting, typing, shorthand, and other business courses are desirable.

If your high school offers shop programs, it is a good idea to take advantage of them if you plan to pursue that field of training.

Columbus Tech
Columbus, Georgia

TO: All High School Counselors and Students

SUBJECT: Vocational-Technical School Entrance Test Dates

FROM: Columbus Tech, Admissions Office

A pre-entrance test is required for admission to the school. The testing program has been established to help the potential student clarify educational and vocational objectives. Tests can be used to help the potential student get an understanding of his or her abilities and then make a vocational decision that is realistic. The test aids in counseling and placing students in one of a broad range of courses offered in vocational-technical schools. The entrance test is not meant to make your decision for you but the interpretation is designed to provide you with basic information obtained from the entrance test, and to offer suggestions which should prove helpful in making your educational and vocational plans.

SCHOOL TOURS

All high schools are invited to tour the campus. Below is an outline of how a tour would be condusted. The approximate length of a tour is one hour.

I. General Session (Welcome)
   A. What does a V-T school have to offer
      1. Purpose of the school
      2. Location and History of the school
      3. Objectives of the school

   B. Educational Opportunities
   C. Entrance Requirements
   D. Admissions Procedure
   E. Expenses of Training
   F. Student Opinion of school
   G. Housing
   H. Financial Aid & Part Time Jobs
   I. Selective Service Deferments

II. Department Tours
   A. Questions answered by each department head
      1. Where can I work after graduation
      2. How much can I make
      3. How long is the course
      4. What is the training like
      5. How did you decide to take this course
      6. Why did you decide on a vocational-technical school
      7. How many students in your course
      8. What is the instructor like
      9. How much classwork do you have
      10. How much homework

III. General Session (summary)
   A. Think about courses you have seen
   B. Evaluate the courses in light of your ambition and plans
   C. Welcome any students back for further information
   D. Question and answer session

Groups for touring are kept to a maximum to 15 in number. We feel at Columbus Tech that this is a wonderful opportunity for boys and girls to get a bird's eye view of vocational training and possibly of the vocation they are particularly interested in.

If you are limited in transportation, try to include those students that you feel would gain the most benefit from this experience.

It may be helpful if after the trip you arrange to meet with the students in groups or individual counseling sessions to

further assist them in determining if the courses offered at Columbus Tech seem reasonable for them to enter.

If you feel that the Columbus Tech school counselor could be of help to you in conferences with your students after returning to school do not hesitate to call on us.

To schedule a tour please fill out the below form and return to:

We have two locations: A Central Admissions Office located at 4460 River Road and Branch #1 located on Forest Road. Consult page 6 in the manual for a list of courses offered at each location. We will send you a confirmation on your tour to the vocational school.

SERVICES TO COUNSELORS

1. Columbus Tech will publish a newsletter each trimester.

2. Columbus Tech will furnish you a list of students from your school by departments.

3. Columbus Tech will furnish you a progress report on each of your former students at the end of the fall trimester.

4. Columbus Tech will furnish you a letter each time a student is accepted from your school showing course entered and school entrance date.

MISCELLANEOUS INFORMATION

Entrance Dates:

Columbus Tech enters students normally only once a year. This is the beginning of the fall trimester. Under certain circumstances a student maybe admitted at a later date by going before our admissions committee. We do not admit new students each trimester.

Length of Trimester:

A trimester is 15 school weeks in length with three trimesters making a school year.

Part Time Training:

Columbus Tech encourages full time training. We do have a limited number of courses open for part time preparatory. For part time courses contact the school.

APPLIANCE SERVICING

Appliance Servicing is a one year, pre-employment course designed to prepare the student for employment at entry levels in the servicing and repair of all types of household appliances. Both theoretical and practical training are provided for persons who desire to enter this field. The program develops the necessary background in electricity and the related sciences.

The instructor is a master craftsman in his field and is a professionally-trained and state certified teacher. The course occupies a modern classroom-laboratory, equipped with the most modern equipment as is found in industry. Facilities are among the finest available.

Appliance servicemen are employed in almost every locality; in dealer service departments, independent repair shops including general repair establishments, as well as in shops specializing in a particular type of repair work. Many such servicemen are self-employed. Employment opportunities in this field are expected to increase in the years immediately ahead due to the widespread use of electrical appliances.

Course Outline

AUTOMOTIVE MECHANICS

Automotive Mechanics is a pre-employment course designed to prepare the student for employment at entry levels in the repair and maintenance of automobiles and light trucks. The program of instruction consists of theory, practice, and maintenance in the disassembly, assembly, and diagnoiss of various types of engines, carburetors, fuel pumps, generators and alternators, starters, ignition systems, clutches, transmissions, rear axles, front ends, and power and hydraulic automotive brakes.

The instructor is a master craftsman in the field of Automotive Mechanics, and is a professionally-trained and state certified teacher. The Automotive Mechanics occupies a modern classroom-shop unit, fully equipped with machinery and tools of the most modern kind, and contains instructional units of all types for student work. These facilities are among the most modern and up-to-date available in the state.

The Automotive Field is vast. We are known as a "nation on wheels". Out of every seven workers, one is employed in the Automotive field. Jobs are available in automotive maintenance and repair. These jobs are found in garages, service stations, company fleet units, public utilities, and government organizations. Auto Mechanics may advance into supervisory positions and allied fields, such as salesmen, managers, owners, etc.

MASONRY

Masonry is a pre-employment course designed to prepare the student for employment at entry levels in brick, tile, and stone masonry. In this program students learn to use, care for, and handle safely the tools, machines, and materials commonly used in this area. The course consists of brick masonry, concrete finishing, blue print and plan reading and drawing. The course in masonry is geared to train young men to become proficient brickmasons.

The instructor is a master craftsman in the field of masonry and is a professionally-trained and state certified teacher. The masonry department occupies a modern classroom-laboratory, equipped with the most modern equipment as found in industry. Facilities are among the finest available.

Graduates specialize in various aspects studied in the program or do general masonry work utilizing a combination of skills. Many men in this field are self-employed. Employment opportunities in this field are expected to increase in the years immediately ahead due to the anticipated increase in construction activities. Technological developments in construction techniques and materials also contribute favorably to the job outlook.

BUSINESS EDUCATION

Business education is a one year, pre-employment course designed to prepare the student for employment at entry levels in a choice of three areas: Accounting, clerical, and secretarial. Both theoretical and practical training are provided for persons who desire to enter this field. This program develops the necessary background for a position in business.

The instructors are professionally-trained and state certified teachers. The course occupies a modern classroom-laboratory, equipped with the most modern equipment as is found in the business world. Facilities are among the finest available.

Business education students are employed in almost every locality; secretarial, general clerical, and accounting. Some of the positions available in the secretarial field are: Legal, medical, and executive secretaries; in general clerical or office clerk, typist, record clerk, and file clerk; in accounting are bookkeeper, and accounting clerk. Opportunities for business personnel are limited for they are employed in every business and industry as well as in Federal, State, and Local governmental agencies.

COSMETOLOGY

Cosmetology is a 13 month, post high school, pre-employment course designed to prepare the student for employment in the field. Cosmetology training includes a thorough study of all phases of beauty culture in both classroom theory and shop practice. Students are prepared to perform all the services usually available in beauty shops.

The instructor is a master beautician and a professionally-trained and a state certified teacher. The course occupies a modern well-equipped classroom-laboratory, equipped with the most modern equipment as is found in beauty shops. Facilities are among the finest available.

Upon graduation, students qualify to take the State Board of Cosmetology Examination to become licensed beauty operators. Graduates may become specialists in a large shop working as a hair color expert, a manicuriest or a certified specialist to remove superfluous hair. They may be employed in a small shop as a general beautician performing all duties which customers require or own and operate their own shops in which case they would also perform such managerial duties as record keeping, property maintenance, control of supplies and supervision of employees.

DATA PROCESSING

Data Processing is a two year post high school, pre-employment course designed to prepare the student as a junior programmer in the field of Data Processing. The course of instruction includes accounting, data processing math, communication skills, punch card applications, programming, computer applications, and a field project.

The instructor is professionally-trained and a state certified teacher. The course occupies a modern classroom-laboratory equipped with the most modern equipment as is found in industry. Facilities are among the finest available.

There are many specialist jobs in data processing, ranging from the technicians who plan the programs to solve the problem, to the programmer who translate the verbal plan into machine language, to the operator who uses the machines to the typist who decodes and translate the rolls of punched tape into printed records.

Course Outline

DATA PROCESSING TECHNOLOGY
(First Year)

1st Trimester	Classroom	Lab	Total
Elementary Accounting I	75	75	150
Business Mathematics I	75		75
Punch Card Machines	75	75	150
Communication Skills I	75		75
			450

2nd Trimester			
Elementary Accounting II	75	75	150
Data Processing Math I	75		75
Punch Card Machines II	75	75	150
Communication Skills II	75		75
			450

3rd Trimester			
Cost Accounting	75	75	150
Computer Fundamentals	75		75
Data Processing Math II	75		75
Punch Card Applications	75	75	150
			450

DATA PROCESSING TECHNOLOGY
(Second Year)

4th Trimester	Classroom	Lab	Total
Intermediate Accounting I	75	75	150
Computer Programming	75	75	150
Programming Systems	30	45	75
Economic Principles	75		75
			450

5th Trimester			
Intermediate Accounting II	75	75	150
Computer Programming II	75	75	150
Advanced Programming Systems	30	45	75
Business Psychology	75		75
			450

6th Trimester			
Business Statistics	75		75
Computer Applications	30	45	75
Business Systems Design & Development	75		75
Data Processing Field Project		225	225
			450

TOTAL HOURS 2700

DISTRIBUTIVE EDUCATION

Distributive education is a post high school, pre-employment course designed to prepare the student for employment in marketing, distribution, or management. Training is offered in mid-management, marketing , advertising, business administration, wholesale and retail services.

The instructor is professionally-trained and a state certified teacher. The instructor has had experience in distribution and sales in business and industry. The course occupies a modern classroom-laboratory, equipped with the most modern equipment as is found in business. Facilities are among the finest available.

Graduates of distributive education are employed in management, marketing, advertising, business administration, wholesale and retail services.

ELECTRONIC TECHNOLOGY

Electronic Technology is a two-year, post high school, pre-employment course designed to prepare the student for employment as a technician in the field of Electronics. In general, students are trained to apply theoretical knowledge and manual skills to such tasks as the preparation or interpretation of layouts and other diagrams and the design of intricate electronic units. They will be able to diagnose troubles in equipment, conduct tests for verification, and make necessary repairs. The course of instruction includes technical mathematics, technical drafting, applied physics, direct current circuits, time varying circuits, basic electronics and shop processes the first year. The second year covers advanced electronics circuits and systems.

The instructor for the course is a professionally-trained and state certified teacher. The course occupies a modern classroom and laboratory unit which contains all of the basic and advanced instructional equipment. These facilities are among the finest and most complete found in the state.

Electronics Technicians are employed in plants producing electronic equipment, in research activity, in the Department of Defense, the Federal Aviation Agency, the military services, various state and local governmental units, tabulation and computer field in various types of manufacturing plants and in radio and television equipment maintenance. The Electronic field is so broad that some go into specialized fields - for example - induction or dielectric heating, servomechanisms, ultrosonics, etc. Ther are used in special maintenance and repair jobs where knowledge above the routine repair level is needed. This has been one of the fastest growing occupational groups and there is an indication of continued growth.

Course Outline

ELECTRONIC TECHNOLOGY

1st Trimester	Classroom	Lab	Total
Applied Algebra	75		75
Physics - Mechanics	45	60	270
D.C. Fundamentals	180	90	270
			450

2nd Trimester

TOTAL HOURS 2700

MACHINE SHOP

The Machine Shop course is a program of pre-employment training designed to prepare the student for employment at entry levels in the machine shops of industries. The program of instruction covers both theory and practice and includes installation, care, and repair of machines found in machine shop; job interpretation, set-up, and operation required to complete work in a manner acceptable to industry; and tool care, repair, and basic tool and die making. A student is encouraged to advance at a rate commensurate with his capabilities; advancement is dependent upon the individual's performance of established standards for each unit of the course.

The instructor is a master craftsman in the fields of Machine Shop Theory and Practice, and is a professionally-trained and state certified teacher. The Machine Shop occupies a modern classroom-shop unit which is equipped with machinery and tools that are found in industry. There are facilities for both hot and cold working processes, materials testing, and metallurgy. The facilities are among the most modern and up-to-date to be found in the state, as evidenced by their constant usage by local industry.

The Machinist Trade is a great trade -- in its necessity, in its interest, and in its opportunity for advancement. Ninety percent of foremen and superintendents of manufacturing plants were promoted from the ranks of Machinists. Because of scientific management, quality control practices, improved production methods, the Machinist is on a higher level. There is an increasing demand for Machinists in plant maintenance shops, metal industrial plants, utility shops, machine shops, and government organizations. They are employed in almost every locality and industry because of their skill.

Course Outline

MACHINE SHOP

1st Trimester	Classroom	Lab	Total
Machine Shop Theory & Practice	75	225	300
Basic Mathematics	75		75
Blueprint Reading	75		75

MECHANICAL TECHNOLOGY
(Design & Production)

The course in Mechanical Technology is a two-year, post high school, pre-employment course designed to prepare the student for employment as a Technician in one of two specialized fields: Design or Production. The term Technician is used to describe a large and loosely defined group of occupations at many levels of skills and with a wide variety of training requirements. The DESIGN Technician must have a background of basic mathematics and engineering science, complete familiarization with modern machine tools - their limitations and capabilities, together with ability to perform adeptly on the drafting board. The PRODUCTION Technician must have a background of mathematics and the engineering sciences, familiarization with machine tools, and a working knowledge of modern production methods including material handling systems, plant layouts, and methods of determining production costs.

A new classroom and labortory unit located in a new modern building, and other auxiliary features, fully equipped with the latest in modern machine tools and precision instruments provides one of the most modern and up-to-date facilities of its kind in the entire country.

Mechanical Technician will be employed in manufacturing plants of all kinds. It is estimated that as a result to Automation and other modern industrial advances, 200,000 trained Technicians will be needed in industry each year for the next 10 years. Technicians to fill jobs such as: Cost ananysis technician, Design checker, Engineering assistant, Laboratory technician and tester, Production planner, Tool designer, and many others.

MEDICAL OFFICE

Medical Office Assistant's Course is a one-year pre-employment course designed to prepare the student for employment at entry levels in a doctor's office. The fundamental role of the medical assistant is to act as a public relations agent between the physician and his patients and to assist him in many clinical situations. Among her duties may be those of a Secretary, receptionist, technician, or doctor's assistant. She will be able to vary her role and responsibilities depending on the number of office personnel and on the specialty of her employer.

The instructor is professionally trained and a state certified teacher. The course occupies a modern classroom-laboratory equipped with the most modern equipment as is found in a physician's office.

Graduate of this program may be the only assistant a doctor has in his office. They may have specialized duties as one of several assistants or may go with a hospital, clinic, special care institution, or public health service as a trained medical office assistant. There are many possibilities now open and the number is rapidly increasing.

Proposed

Course Outline

MEDICAL OFFICE ASSISTANT

RADIO AND TELEVISION SERVICING

Radio and Television Servicing is a twenty-two month, pre-employment course designed to prepare the student for employment at entry levels in the repair and servicing of radio receivers (including transistors), televsion receivers (including color and closed circuit), and high fidelity and other associated equipment. The program develops the necessary background in mathematics, electricity, and the related sciences.

The instructor is a master craftsman in his field and is a professionally-trained and state certified teacher. The course occupies a modern classroom-laboratory, equipped with the most modern equipment as is found in industry. Facilities are among the finest available.

Many Radio and Television servicemen are employed in small repair shops; often they are self-employed, operating their own shops. Some are employed in large repair shops including service branches of large manufacturing companies. Appliance stores, department stores and other sales outlets for radios and television sets also employ repairmen in their service departments. Electronic servicemen will continue to have excellent opportunities in the 1960's. Widespread introduction of color television is expected to increase the demand for servicemen in the years immediately ahead. Not only employment increases in existing fields, but many new areas of electronics work are expected to develop.

Course Outline

REFRIGERATION AND AIR CONDITIONING

Refrigeration and Air Conditioning is a pre-employment course designed to prepare the student for employment at entry levels in the fields of Refrigeration and Air Conditioning. Both theoretical and practical training are provided for persons who desire to enter this field. Instruction is directed toward meeting the need for technically-trained personnel in the fields of system design and layout, equipment installation, maintenance, and servicing. The program develops the necessary background in mathematics, electricity, and the related sciences.

The instructor is a master craftsman in his field and is a professionally-trained and state certified teacher. The course occupies a modern classroom-laboratory, equipped with the most modern equipment as is found in the industry. Facilities are among the finest available.

Workers are employed in all parts of the country, because of the widespread use of Refrigeration and Air Conditioning equipment. The demand for additional mechanics is growing because of the increase use of refrigeration and air conditioning equipment in industrial, commercial and home use. Refrigeration and Air Conditioning mechanics may work with contractors, maintenance companies, large industries and utilities, government organizations, department stores, general servicing, and may go into business for themselves. The future looks unlimited as the need increases in industrial, commercial, and home use, and in the manufacture of new products.

Course Outline

UPHOLSTERY

Upholstery is a one and a half year, post high school, pre-employment course designed to prepare the student for employment in the field of upholstery. This course is designed to train students to become proficient in furniture upholstery, selection and proper use of materials and their application, the maintenance and use of hand tools and machinery used in the trade.

The instructor is a master craftsman in his field and is a professionally-trained and state certified teacher. The course occupies a modern classroom-laboratory, equipped with the most modern equipment as is found in industry. Facilities are among the finest available.

Upholstery graduates are employed in almost every locality. Many upholstery graduates are self-employed. Employment opportunities in this field in the years immediately ahead are expected to increase.

WELDING

Welding is a one year, pre-employment course designed to prepare the student for employment at entry levels in the welding field. Both theoretical and practical training are provided for persons who desire to enter this field. The purpose of this course is to provide a sound training program of the skills involved in welding along with a background of technical information needed by the modern welder.

The instructor is a master craftsman in his field and is a professionally-trained teacher. The course occupies a modern classroom-laboratory, equipped with the most modern equipment as is found in industry. Facilities are among the finest available.

Welders are employed in almost every locality. Graduates of this program will be prepared for employment in motor vehicle and equipment plants, construction companies, metal working repair shops, sheet metal shops, or pipe line construtior companies.

QUESTIONS

1. What do I have to do to be accepted? Refer to steps of admission.

2. Can I be deferred from military service? According to our present law you can if you maintain satisfactory grades and your attendance is regular.

3. Is the school accredited? We are licensed under the State Board of Education to operate thru the Muscogee County School District and the Department of Vocational Education Department.

4. What about a job after graduation? Columbus Tech maintains a placement service for graduates applying for full-time positions.

5. When can I apply? Applications can be made at any time. Students for September enrollment are encouraged to apply by at least the preceding January.

6. How much does it cost? Supply fee of $20.00 per trimester plus cost of books and personel supplies. As a rule, the training is approximately $12.00 per month. This includes the cost of all books.

7. How long is the school day? Normal school days are from 8:30 a.m. till 3:30 p.m., Monday thru Friday.

8. How long is a trimester? Fifteen school weeks with three trimesters making a school year.
   Fall trimester - September 1 thru December 15
   Winter trimester - December 16 thru April 15
   Spring trimester - April 16 thru July 30

9. Can I go at night or part-time? Not as a general rule on pre-employment courses. Some training is offered on a very limited scale. For more information contact Columbus Tech.

10. How am I graded? In arriving at your grade more is involved than just the grades that you make on written tests. The following areas will be used in determining your grade:

    a. Courtesy, leadership, promptness, thoroughness, and dependability.
    b. Industriousness, mental alertness, general alertness, and personal appearance.
    c. Following instructions, accepting responsibility, ability to get along with others, and ability to apply related technical information.
    d. Written classwork and test.

11. Can girls attend this school? Yes, we have offerings for girls in Business Education, medical office assistants, data processing, distributive education, cosmetology, upholstery, electronics and others.

The Navajo Rehabilitation Project, Pre-Vocational Laboratory. Navajo Rehabilitation Project Technical Report No. 8.

Northern Arizona Univ., Flagstaff

Vocational Rehabilitation Administration (DHEW), Washington, D.C. RD-1213-G

MF AVAILABLE IN VT-ERIC SET.

Pub Date - 67 37p.

*NAVAHO; VOCATIONAL APTITUDE; ADULT EDUCATION; *EVALUATION METHODS; *VOCATIONAL REHABILITATION; PROGRAM DESCRIPTION

*PROJECT NAVAJO REHABILITATION

The Pre-Vocational Laboratory used work sample techniques, dexterity tests, and other observational methods to evaluate the vocational abilities of the Navajo rehabilitation clients. Because of English language handicaps and different cultural values, the Navajo clients had unique problems in the laboratory situation. They were unfamiliar with many of the tools and machines and the whole concept of evaluation. They had limited work experiences. A final report was made on each client and recommendations were made for placement in training or directly on a job where they would probably experience a success. (MM)

ABSTRACT

The Pre-Vocational Evaluation Laboratory of the Navajo Rehabilitation Project used a work sample method of assessment to evaluate the vocational abilities and aptitudes of a disabled group of Navajo clients.

Among the different types of tasks offered in the Pre-Vocational Laboratory were leather and jewelry work, electrical wiring, welding, typing and business machine operation, woodworking, and other tasks. The Navajo clients were usually evaluated in most of the available areas because their job interests were vague and limited.

On two dexterity tests administered in the Laboratory, Navajo clients scored highly (68th percentile) on the O' Connor Finger Dexterity Test, and poorly on the Minnesota Rate of Manipulation (significantly below the standardization group at the .01 confidence level). Their finger dexterity was apparently above average, while their dexterity in a task of more gross rapid body movements was well below average. Since there are no norms for a disabled population, it is difficult to interpret these test data.

The evaluation made in the Laboratory was often subjective in nature, but it was hoped that the validity of such an evaluation could be more adequately determined in the future with the establishment of norms for many of the tasks, and with a long-term follow-up research study of rehabilitation clients.

CHAPTER I

INTRODUCTION

The Meaning and Purpose of Pre-Vocational Evaluation in Rehabilitation

Moed (1960, P. 1), in a review of current procedures in pre-vocational evaluation of the disabled, stated that pre-vocational evaluation may be divided into several components, which are "realistic vocational appraisal, appraisal of behavior dynamics in a work situation, and a therapeutic work experience which helps the individual gain a better understanding of himself as a worker." Pre-vocational evaluation is a practical method of measuring vocational effectiveness (Allan, 1958, P. 78). It is the use of supervised work to provide a practical test for the evaluation and development of work skills and attitudes.

Pre-vocational evaluation units may be housed in a variety of facilities. The most common of these are a separate pre-vocational evaluation unit, an occupational therapy department, or a sheltered workshop (Moed, 1960). These units are found in either a medically or a vocationally oriented rehabilitation setting. A center with a medical orientation is primarily concerned with work tolerance, while a vocationally oriented center is concerned with exploring and developing the vocational potential of the client.

There are various methods of vocational appraisal, including the work sample method, the use of sub-contract production, psychometric evaluation, and industrial engineering techniques.

The most frequently used method of vocational appraisal is the work sample (Moed, 1960, P. 2). This method was the one primarily used in the Navajo Rehabilitation Project. The work sample tasks are designed to resemble actual job situations. Though sampling in all occupations which offer possible employment is not practical, enough tasks are assigned in a variety of areas to predict general areas of vocational success.

One of the major exponents of the work sample technique is the Institute for the Crippled and Disabled. Their work sample method is called the TOWER System, which stands for Testing, Orientation, and Work Evaluation in Rehabilitation (Institute for the Crippled and Disabled, 1960, P. 50). The TOWER System consists of thriteen broad areas of vocational evaluation, including Clerical, Drafting, Drawing, Electronics Assembly, Jewelry Manufacturing, Leathergoods, Lettering, Mail Clerk, Optical Mechanics, Receptionist, Sewing Machine Operating, Workshop assembly, and Welding.

A pre-vocational unit in a rehabilitation center is usually a vocational evaluation laboratory. According to Allan (1958, P. 79), the client should be given at least three weeks of work in the laboratory, and during that time he should have a trial in the performance of a variety of work experience.

The ideal Pre-Vocational Evaluator is a composite of a counselor, a teacher, a tester, an occupational therapist, and a person with industrial experience; yet, it is difficult to obtain evaluators with all these qualifications. Most evaluators in pre-vocational laboratories come from an industrial setting or from college industrial education departments. These backgrounds in many ways come nearest to meeting the requirements for the job of Pre-Vocational Evaluator, and these were the sources drawn upon for the Pre-Vocational Evaluators at the Navajo Rehabilitation Project.

The Pre-Vocational Evaluation at the Navajo Rehabilitation Project

The Pre-Vocational Evaluation at the Navajo Rehabilitation Project was designed as a separate unit within the Project. The Project was vocationally oriented and one of its primary purposes was to develop techniques for the vocational evaluation of disabled Navajos.

The Navajo Rehabilitation Project Pre-Vocational Evaluation Unit used the work sample technique and several of the TOWER tests. As the Project evolved, new paper and pencil tests were added to the evaluation, and the TOWER tests were revised to suit the Navajo client group. Also, dexterity tests were added to the evaluation.

CHAPTER II

DESCRIPTION OF THE NAVAJO REHABILITATION PROJECT

PRE-VOCATIONAL EVALUATION

Purpose

The objectives of the Pre-Vocational Evaluation were to evaluate as many aspects of each client's vocational capabilities as possible, to observe and report on the physical and mental limitations of each client, to keep research notes on the client, and to introduce many varied samples of vocations and different tools to the client.

Throughout the Pre-Vocational Evaluation, the emphasis was on assessment of the client in the following areas: educational background, previous work history, present abilities, aptitudes, potentials, interests and hobbies, physical and mental limitations, and personal characteristics and attitudes towards work.

Another purpose of the evaluation unit was to establish performance norms and evaluation procedures for the Navajo clients.

Description of the Facilities

The Pre-Vocational Evaluation Unit was organized into a comprehensive general shop with a variety of activities conducted simultaneously. It was both a shop facility and an experimental facility, since the work conducted was directed towards research as well as evaluation. The Unit was later relabeled the "Pre-Vocational Labortory."

The Pre-Vocational Laboratory was first located in a small room on the bottom floor of the Northern Arizona University Applied Arts Building. The Laboratory was converted from a classroom and proved inadequate as an evaluation shop facility because of limited floor space.

The smallness of the Laboratory limited the number of clients, and the type of tasks that could be performed simultaneously. The Laboratory facility was used from the beginning of the Project until August, 1966. At that time, the Laboratory was moved into the new Northern Arizona University Rehabilitation Center. The new Laboratory has space for the simultaneous evaluation of twelve to fifteen people. A separate testing room is available for the administration of eye examinations and manual dexterity tests. Another feature of the Laboratory is a glass enclosed office where private conversations can take place without isolating the evaluator from viewing the Laboratory.

Equipment

The Pre-Vocational Laboratory was equipped with tools and machinery that duplicated or resembled those used in industry. Peterson and Parnicky (1963, P. 15) stress that the underlying rationale of pre-vocational evaluation programs is that "the closer the testing situation approximates the real life setting, the more accurate the evaluation will be and the more meaningful the experience." Though the Laboratory tried to simulate actual job situations, this was not entirely successful since there were no monetary rewards for performing the tasks adequately.

The tools, machines, and other equipment in the Laboratory were donated to the Project by various groups--the Navajo Tribe, Arizona Blind Services, and the Division of Vocational Rehabilitation. A list of the shop equipment is in Appendix A of this report.

CHAPTER III

PRE-VOCATIONAL METHODS AND PROCEDURES

Tests Used

The major portion of the evaluation tests were obtained from the TOWER System. The Laboratory used five of the thirteen available tests. These were Clerical, Drafting, Jewelry Manufacturing, Workshop Assembly, and Leathergoods. Portions of the other eight TOWER Tests, plus some locally developed appraisal methods comprised the remainder of the Pre-Vocational Evaluation. The Training and Reference Manual for Job Analysis (Department of Labor, 1944) was used to establish the evaluation procedures in the Laboratory. Job sample tasks were designed to resemble actual jobs. If a client could perform the type of tasks the specific job required, it was assumed he could do the actual job. A list of all the tasks used in the Laboratory is in Appendix B.

Description of the Pre-Vocational Evaluation Process

After the Navajo Rehabilitation Project was well established, the rehabilitation staff began evaluating other disabled clients, including Mexican-American, Negroes, Caucasians, and other Indian groups. Thus, a general comparison of the Navajo clients with other rehabilitation clients ultimately could be made. The evaluation process was similar for all clients. However, Navajo clients were usually given a longer period of evaluation than was required for other rehabilitation clients. The reasons for this difference were that most of the Navajo clients were unfamiliar with the tasks they were required to perform in the Laboratory; they often had limited or no work experience; and were unfamiliar with many of the tools and machines used in the Laboratory. Also, data on Navajos was needed to meet the research aims of the Project.

The evaluation began with a personal interview to establish rapport with the client. This interview was

followed by a physical capabilities questionaire, an eye examination on the Telebinocular or Ortho-rater, and some dexterity tests. The remainder of the evaluation was composed of practical examinations and a variety of job sample tasks. Because the Navajo clients seemed to dislike the practical paper and pencil tasks, several different methods of presenting the sample tasks and the practical examinations were tried. To increase interest and motivation, the Evaluator usually alternated the manipulative and the written tasks. The client was often started in a work sample task in which he was interested. After the relationship between client and Evaluator was improved, the client would be more willing to attempt the written tasks.

A Navajo client was left in one phase of the evaluation long enough to assess his performance in that area. The client was then moved to a different phase of the evaluation, and this phase was continued until he had completed the Laboratory evaluation. The observations made of the client's attitudes, interests, aptitudes, and abilities in the Laboratory were then summarized on a final assessment sheet (see Appendix C). A final report was written on each client, discussing his general performance in the Laboratory, and giving recommendations for job possibilities for the client. General, rather than specific, recommendations for vocations were given, so that the client would not be limited to the specific vocational areas simulated in the Pre-Vocational Laboratory.

The total evaluation time in the Laboratory varied for each client. During the Project's existence the evaluation time was continually shortened because the staff felt they knew more about the evaluation of Navajos, and could evaluate them effectively in a shorter period of time. Originally the client was in evaluation three hours a day for seven or eight weeks. Gradually this was shortened to six weeks, four weeks, and finally three weeks.

It was often difficult to evaluate Pre-Vocational Laboratory performance objectively. There is no normative data available as yet on the use of the TOWER Tests, though a study is in progress (see Appendix D). To create a more objective evaluation, the evaluation consisted of several phases, and each client was evaluated by more than one Evaluator. Thus, there was some opportunity to

check reliability and the construct validity of these evaluations. Without long term follow-up of employment histories, studies of predictive validity of pre-vocational evaluation are somewhat questionable.

CHAPTER IV

RESULTS OF SEVERAL EVALUATION METHODS EMPLOYED IN THE PRE-VOCATIONAL LABORATORY

The O'Connor Finger Dexterity Test (O'Connor, 1926) was constructed to evaluate a person's ability to rapidly manipulate objects, especially the picking up and placing of small parts. This test is used in the selection of pivot setters, gear train assemblers, and meter assemblers. The mean time on this test for thirty-seven Navajos evaluated in the Pre-Vocational Laboratory was 248 seconds, faster than the mean for the standardization group, which was 262 seconds. The range of scores for Navajos was 180 seconds (99th percentile) to 360 seconds (11th percentile). Because of a lack of statistical data on the O'Conner, it was not possible to compare the standard error of the difference between means. However, the average Navajo client scored at approximately the 68th percentile on this test.

The Minnesota Rate of Manipulation Test (Educational Test Bureau, 1957) is used to evaluate manipulative skills. This test was developed from a test used by the University of Minnesota Employment Stabiliation Research Institute. The present form of the Minnesota Rate of Manipulation is now used by public employment offices, and in trade and industry. The test has two parts: Placing and Turning; which were standardized on Minneapolis' Public Library patrons with a median age of nineteen. Results of administering this test to thirty-four Navajo Rehabilitation Project clients evaluated in the Laboratory showed that the average Navajo client was slower than the first percentile on both parts of the test. Mean scores for Navajo clients were 188 seconds for Placing and 165 seconds for Turning. The highest score obtained by a Navajo was the 90th percentile on the Placing test and the 80th percentile on the Turning test. Thus, a sample of Project clients scores significantly (at the .01 confidence level) slower than the test norm population.

The Personnel Test for Industry, Form S (Langmuir, 1954) was used in the Pre-Vocational Laboratory. This test of general abilities was designed specifically for industrial use in personnel selection. Form S consists of thirty-nine scorable responses, and requires fifteen minutes to administer. The oral directions and test administration are pre-recorded on a standard tape. Navajos who took this test were compared with textile mill applicants, who were the lowest of the nine norm groups. The mean score for the Navajo clients was 14.41 (24th percentile) while the mean score for the textile mill applicants was 21.1 (50th percentile). Therefore, the Personnel Test for Industry also produced Navajo Rehabilitation Project client scores significantly (at the .01 confidence level) below the standardization population.

Two other tests that were developed in the Laboratory by the Pre-Vocational Evaluators were the Practical Knowledge Task and the Read-A-Rule Task. These tasks tested knowledge of measurements and practical mathematics. No normative data is yet available on these tests, so it is not possible to compare Navajos with other groups taking the tests. The mean scores for the Navajo clients on these tests are available, however, in Table I.

Discussion of the Test Results

The Navajo Rehabilitation clients scored better than average on the O'Connor, which is a test of rapid manipulation of small parts, while on the Minnesota Rate of Manipulation their scores were, in general, quite poor. In the Examiner's Manual for the Minnesota (1957, P. 3), the authors mentioned that this test measures more than speed in finger, hand, and arm movements. "It appeared to many psychologists that the functional involvement was more extensive than this, that it also included gross body movements, intelligence, vision, and perseverance."

Apparently, the Navajos tested on the O'Connor were not penalized by their disabilities. They could perform well on a test of finger dexterity. However, when a test of more gross body movements was given them, they performed poorly. It is possible that a disabled group of clients would also perform poorly on this test; since

there is no normative data available for a disabled population, it was not possible to compare the performance of Navajo clients with the performance of other disabled groups.

On the Personnel Test for Industry, Navajos scored much lower than the general population. This test is given orally, and penalized those who are English language handicapped. Since most Navajos speak English as a second language, it was probably often difficult for them to understand the instructions, and their scores were lowered as a result.

TABLE I

COMPARATIVE DATA FOR NAVAJO REHABILITATION CLIENTS
ON SEVERAL TESTS USED IN THE LABORATORY

	NORM GROUP		NAVAJO REHABILITATION PROJECT CLIENTS

CHAPTER V

NAVAJO REHABILITATION PROJECT CLIENT CHARACTERISTICS

In comparing the evaluation time for different client groups, it was found that the Navajos required a longer evaluation period, in general, than other rehabilitation clients. More time was required for Navajos because of client attitudes and cultural differences.

It was usually more difficult to establish rapport with Navajo clients than with other Laboratory clients. Frequently the Navajos conversed with each other in their native language, and preferred to be with other Navajos. This need lessened as the evaluation progressed, and a friendly relationship was usually established between client and Evaluator.

Many of the Navajo clients began the evaluation with a negative attitude. This was usually the result of misunderstanding the purposes of the evaluation, or feeling threatened by a confusing situation. These characteristics were more prevalent among the Reservation-oriented clients who were unfamiliar with industrial settings.

The Navajos were usually quiet while in the Laboratory, and were reluctant to express their feelings about their Laboratory experiences. They seemed less aggressive, less self-directive, and more socially withdrawn than other non-Indian cultural groups.

The average Navajo client entering evaluation had less formal education than other ethnic groups. The average grade completed by the Navajo Rehabilitation Project clients was the sixth, while for other cultural groups it was the ninth. Many Navajo clients were also handicapped by their inability to communicate effectively in English. This lack of education was a detriment to the client's performance in the Pre-Vocational Evaluation Laboratory.

The Navajo clients were also often lacking in work experience. Since there is limited industry on the Navajo Reservation and most Project clients had worked in unskilled jobs, little of the knowledge gained from a Navajo's work experiences could be transferred and applied in the Pre-Vocational Laboratory. This lack of vocational experience and knowledge made it difficult for the Navajo client to know what kind of job he wanted. Often the major desire of the client was only that the job be located on or near the Reservation.

The most usual areas of interest of the Navajo clients were the artistic fields and the hand manipulation tasks, and these were the areas in which they were usually the most competent. These interests are consistent with their relative success on aptitude tests. For example, the majority of Navajo Rehabilitation Project clients scored highest on the Block Design Sub-test of the Wechsler Adult Intelligence Scale, though their mean score was still slightly below the mean of the average population. Most Navajos appeared to have better than average ability in drawing, sketching, and flat-plane and space perception. They also appeared to have good finger dexterity and hand manipulation, which was indicated by their above average performance on the O'Connor Finger Dexterity Test. They achieved on this above the norm group, even though some of them were able to use only one hand or were otherwise handicapped.

When assigned tasks such as drafting, leatherwork, or jewelry-making, the Navajos appeared to feel competent in their abilities. They were very imaginative and created many of their own designs. The Navajos scored below average in mechanical tasks, usually because they had no knowledge of basic mechanical principles. Once the concept was understood by the clients, they usually completed such tasks successfully, though slowly.

Navajos do not have as rigid a time concept as do members of the dominant United States culture. This difference was evident in the timed tests in the Laboratory. Many of the clients did not understand the idea of doing a task as rapidly as possible; they preferred to work at their own speed, and consequently, often required more time to complete the tasks than other cultural groups.

One of the major cultural differences noted with Navajo clients was a difference in value orientation. Navajos placed more value on a piece of leather or turquoise than on an equally priced piece of wood or metal used in the Laboratory. They placed less value on tools and machines than did other ethnic groups; and as a consequence, Navajos often were abusive with such equipment.

The actual performance of Navajo clients on job tasks in the Laboratory indicated that they worked more slowly than other rehabilitation clients, but were still within the range of the average population in abilities and dexterity and were usually careful and adequate workers. These observations conflict with the exceptionally low scores the Navajos received on the Minnesota Rate of Manipulation Test. The performance in the simulated job situations in the Laboratory, since they were less threatening than the timed dexterity tests, was thought to be more concrete evidence of the Navajos' true manipulative abilities.

CHAPTER VI

SUMMARY AND CONCLUSIONS

The Pre-Vocational Laboratory used work sample techniques, dexterity tests, and other observational methods to evaluate the vocational abilities of Navajo Rehabilitation clients.

Navajo clients had unique problems in the Laboratory situation because of English language handicaps and differences in cultural experiences and values. They were unfamiliar with many of the tools and machines in the Laboratory, and with the whole concept of evaluation. Their past work experiences were usually limited to seasonal or unskilled work and their knowledge of jobs was narrow. The Navajo clients were assigned a variety of tasks, and the Evaluator noted the client's reactions to each work area. The observations of the Evaluator were then combined into a final report on each client. General recommendations were made for placement in training or directly on a job where they would probably experience success.

It was found that many tasks used successfully with other rehabilitation clients could also be used with Navajos if interpretations of abilities were made cautiously and if a staff has some knowledge of Navajo culture.

Since there is not standardization data on most of the Laboratory tasks, much of the Laboratory evaluation was subjective in nature. Standardization data is needed to make the evaluations in the Laboratory more objective and accurate and more long-term follow-up is needed to satisfactorily validate the pre-vocational evaluation tasks and procedures.

APPENDIX

APPENDIX A

PRE-VOCATIONAL LABORATORY

LIST OF EQUIPMENT

Clerical:

1 dictating machine and transcriber unit
1 electric typewriter and stand
1 twenty-seven drawer file card cabinet
1 tape recorder
1 mail scale
1 electric adding machine
1 paper cutter

Drafting:

2 drafting boards
2 drafting tables
2 drafting sets
2 lettering sets

Electrical:

1 electrical circuit board

Leather Working:

2 work benches
40 saddle stamps
2 mallets
assorted leather tools

Metal Working:

1 metal bench
1 vice
1 bench grinder
1 oxyacetylene welding bench
1 oxyacetylene welding equipment
1 nine-inch lathe
1 air compressor
1 drill press
1 ½-inch portable drill
1 A.C. Arc Welding Machine and Equipment

Plumbing:

cast iron and galvanized pipe for plumbing tree

Power Mechanics:

6 carburators
4 generators
2 starters
1 brake unit
1 fuel pump
1 metal bench
1 automatic transmission
1 set of mechanics tools
1 gasoline engine

Stone Working:

1 18-inch slabbing saw
1 trimming saw
1 grinding outfit
1 cabinet
1 tumbler

Woodworking:

1 lathe
1 jig saw
1 electric sander
1 table saw
1 jointer
1 dust collector
1 four-station work bench
104 assorted hand tools
1 portable electric drill
1 portable electric jig saw
1 router
4 bar clamps
2 hand clamps

Miscellaneous:

12 stools
1 time clock
1 plastic oven
1 plastic buffer
1 semi-automatic sewing machine
4 metal tables
4 metal cabinets
6 metal shelves

DATE: _____

EVALUATOR: _____

NUMBER OF HOURS IN THE SHOP: _____

AREAS COVERED: 1( ) 2( ) 3( ) 4( ) 5( ) 6( ) 7( ) 8( ) 9( ) 10( ) 11( ) 12( ) 13( ) 14( ) 15( ) 16( ) 17( ) 18( ) 19( ) 20( ) 21( ) 22( ) 23( ) 24( )

A. SOCIAL AND PERSONALITY CHARACTERISTICS: The following characteristics are marked in this manner: (1) ALWAYS or USUALLY (2) SOMETIMES (3) SELDOM OR NEVER. "U" is marked if valid judgement cannot be given.

BEHAVIOR ITEMS	1	2	3	U	COMMENTS
1. APPEARANCE. Well groomed, shaved, hair, clothes.					
2. CHEERFULNESS. At work and socially.					
3. CONSTRUCTIVE CRITICISM. Accepts and profits from constructive criticism.					
4. COOPERATION. Gets along well with instructors, etc.					
5. COURTESY. To co-workers, instructors, etc.					
6. PERSONAL HYGIENE. Clean teeth, fingernails, bath					
7. HONESTY. Stealing lying or deceiving.					
8. INDEPENDENCE. Can work independently from instructor.					
9. MANNERISM. Normal gestures and speech habits.					
10. NON-INTERFERENCE. Stays at his own job. Does not bother others.					

BEHAVIOR ITEMS	1	2	3	U	COMMENTS
11. SELF APPRAISAL. Judges his own work abilities realistically.					
12. SOCIAL ADJUSTMENT. Behavior at work and socially is acceptable to others.					
13. TEAMWORK. Works well in a group situation.					
B. WORK ADJUSTMENT AND WORK ATTITUDE					
BEHAVIOR ITEMS					
1.. ATTENDANCE. Present at working time.					
2. CAREFULNESS. With tools and materials.					
3. COMPLETION OF JOB. Finishing the assigned task.					
4. DEPENDABILITY. Reliable on job.					
5. ECONOMY. In use of time, tools and energy.					
6. EFFORT. Tries hard even though ability may be lacking.					
7. INITATIVE. Taking the lead in activities.					
8. MEETS TIME DEADLINES. Adjusts to time pressures.					
9. NEATNESS. Good habits in housekeeping.					
10. PERSEVERANCE. Performs continuously over normal periods.					
11. PUNCTUAL. At work on time and returning from breaks.					
12. QUALITY OF WORK. Accuracy and detail is good.					

BEHAVIOR ITEMS	1	2	3	U	COMMENTS
13. RULES. Follows regulations and rules.					
14. SAFETY HABITS. Uses caution in hazardous activities.					
15. SPEED. Speed is appropriate for type of job.					

C. APTITUDES: This is the individual's ability to perform tasks. This scale compares his degree of ability to that of the average person in the working population. There are six degrees of ability. These are:

1. Extremely high degree of ability
2. Above average
3. Average, or medium degree of ability
4. Below average
5. Very low ability
6. Valid judgment cannot be made

BEHAVIOR ITEMS	1	2	3	4	5	6	COMMENTS
1. FINGER DEXTERITY. Rapidly and accurately manipulates small objects with fingers.							
2.. MANUAL DEXTERITY. Moves hands with ease and skill - as in placing and turning motions.							
3. USE OF HAND TOOLS. Uses tools skillfully.							
4. EYE-HAND-FOOT COORDINATION. Coordinates hands and feet in response to job.							
5. HAND-EYE COORDINATION. Coordinates eyes, hands and fingers.							
6. HAND COORDINATION. Both hands used in coordination.							
7. COLOR DISCRIMINATION. Identifies colors.							

BEHAVIOR ITEMS	1	2	3	4	5	6	COMMENTS
8. SPACE PERCEPTION. Understands relationships of plane and solid objects.							
9. FORM PERCEPTION. Identifies the details of objects, pictures and can compare the differences in shape and size.							
10. COMPUTATION. Adding, subtracting, etc. as required by a job.							
11. MEASUREMENT: Can use various measuring instruments.							
12. SPELLING. Can spell adequately.							
13. COMMUNICATION. Uses words effectively.							
14. WRITING. Can write.							
15. COMPREHENSION. Understands the meaning of words, ideas.							
16. ATTENTIVENESS. Concentrates on a job and is not easily distracted.							
17. DECISIVENESS. Can decide among alternatives on job.							
18. INSTRUCTIONS, VERBAL. Understands and follows verbal instructions.							
19. INSTRUCTIONS, WRITTEN. Can read and follow instructions.							
20. LEARNING ABILITY. Can adapt to a work routine.							
21. PLANNING ABILITY. Plans ahead when working.							
22. MECHANICAL APTITUDE. Has a knowledge of mechanical principles.							
23. RETENTION. Remembers instructions, names, and procedures.							

D. INTERESTS: Indicate the individual's interest in or preference for engaging in various activities below. Indicate "U" if valid judgement cannot be made.

ACTIVITIES	YES	NO	U	COMMENTS
1. Activities involving contact with people.				
2. Activities resulting in tangible satisfaction.				
3. Activities involving objects.				
4. Routine, concrete activities.				
5. Activities which increase his prestige in a group setting.				
6. Working for the good of other people.				
7. Creative or abstract activities.				
8. Activities using machines, techniques, and processes.				
9. Technical activities.				

E. TEMPERAMENT: Indicate whether the individual is capable of adjusting to and performing in the situations below. Indicate "U" if valid judgement cannot be made.

SITUATION	YES	NO	U	COMMENTS
1. Adjusts to various duties with frequent change.				
2. Adjusts to repetitive operations carried out according to set procedures.				
3. Can perform jobs independently with little instruction.				
4. Can direct and control effectively an entire activity.				
5. Deals effectively with people in a job beyond instruction. (secretary or foremen)				

SITUATION	YES	NO	U	COMMENTS
6. Effectively works alone in isolation from others.				
7. Influences attitudes, opinion or judgements of people.				
8. Performs well under stress such as taking a risk.				
9. Makes judgements and decisions on objective criteria. (measurements, standards, tests)				

F. PHYSICAL ABILITIES: Indicate the ability of the individual to perform various physical activities of a job. If you believe he is capable of performing a job which you did not observe, indicate YES and "U". If he is physically handicapped, indicate in COMMENT column.

ABILITY	YES	NO	U	COMMENTS
1. Lifting, carrying, pushing pulling. a. Light work b. Medium work c. Heavy work d. Sedentary work				
2. Agility, equilibrium				
3. Stooping, kneeling and crawling				
4. Reaching, handling, and feeling (upper extremities)				
5. Talking and hearing				
6. Telebinocular Test - Comments				
7. Dominance (circle the appropriate letter)				
a. Hand R L				
b. Foot R L				
c. Eye R L				

G. **WORKING CONDITIONS.** Indicate the ability to work under different types of environment. If you believe he could tolerate a condition which was not observed, indicate YES and "U". If physically handicapped, indicate.

CONDITIONS	YES	NO	U	COMMENTS
1. a. Inside				
b. Outside				
2. Extremes of cold.				
3. Extremes of heat.				
4. Wet and humid extremes				
5. Noise and vibration extremes				
6. Mechanical hazards (lack of phobia)				
7. Toxic conditions, fumes, odors

SUMMARY OF EVALUATION:

APPENDIX D

DEPARTMENT OF REHABILITATION
Navajo Rehabilitation Project

January 23, 1967

Institute for the Crippled & Disabled
TOWER Tests
400 First Avenue
New York 10, New York

Dear Sirs:

We at the Navajo Rehabilitation Project have been using your vocational evaluation tests in the pre-vocational phase of our evaluation for the Navajo Indian clients. In assessing our program, I find that we do not have enough data on your T.O.W.E.R. tests. Information on validity, reliability, sample groups, norms, and test environments would be very helpful at this time.

Please inform me if this information is available, and where it can be located.

I am eagerly awaiting your reply.

Sincerely,

Al Cook
Pre-Vocational Evaluator

AC/ps

March 10, 1967

Institute for the Crippled & Disabled
TOWER Tests
400 First Avenue
New York 10, New York

Dear Sirs:

Enclosed is a copy of a letter written by one of our staff over a month and a half ago, requesting information on the T.O.W.E.R. Tests.

We are in the final stages of researching services rendered to the Navajo Rehabilitation Clients, using, as a part of our research study, the usefullness of different tests. As a background for our report on the T.O.W.E.R. Tests we would like to get from you a copy of or references to any normative data you have on the above mentioned Tests.

It would be a much more meaningful report if we could relate our findings with information you have accumulated on norm groups, reliability, and predictive validity of the T.O.W.E.R. Tests.

Thank you.

Very truly yours,

Norman B. Henderson, Ph.D.
Director, Navajo Rehabilitation Project
Diplomate in Clinical Psychology,

Dear Dr. Henderson:

In reply to your letter of March 10th, addressed to TOWER Tests of this institute, we are currently finishing up this TOWER research and have placed your name on the mailing list to receive the final report.

Sincerely yours,

Myron S. Koltuv

*PROJECT NAVAJO REHABILITATION

The purpose of the Educational Evaluation at the Navajo Rehabilitation Project was to evaluate the functional achievement level and learning ability of the clients. It was found that the actual achievement level of most clients was significantly (.01 level) below the grade they had completed in school. The evaluation of the client was based on achievement test results and subjective rating by the instructor. A written report was made on each client including achievement test scores, classwork, attitudes, and learning ability. Most clients did make some achievement test gains after a short period of remedial instruction. Average gain was .6 of a year and intelligence measures and learning measures were significantly correlated (.05 level) with verbal measures of intelligence correlating more highly than performance measures. The Educational Evaluation was valuable in indicating that many clients could benefit from remedial education and was instrumental in the establishment of the Pre-Vocational Education Program. (MM)

ABSTRACT

The purpose of the Educational Evaluation at the Navajo Rehabilitation Project was to evaluate the functional achievement level and learning ability of the clients. It was found that the actual achievement level of most Navajo Rehabilitation Project clients was significantly below (.01 level of confidence) the grade they had completed in school. The Navajo Rehabilitation Project staff felt that the clients' ability in reading, writing, and mathematics might affect his vocational potential.

The Educational Evaluation of the client was based on achievement test results, and a more subjective rating by the Instructor. A written report was made on each client, including achievement test scores, classwork, attitudes, and learning ability.

In a study of the Educational Evaluation Results, it was found that most of the clients did make some achievement test gains after a short period of remedial instruction. The average gain was .6 of a year. It was also found that intelligence measures and learning measures were significantly correlated (at .05 level of confidence), with verbal measures of intelligence correlating more highly than performance measures. These correlations ranged from .41 to .86, and, in general, gains in the language portions of the achievement tests were made by clients who scored poorly on the intelligence measures. Correlations ranged from .52 to .72, and were significant at the .05 level of confidence.

The Educational Evaluation was valuable in indicating that many of our clients could benefit from remedial education, and was instrumental in the establishment of the Pre-Vocational Education Program.

CHAPTER I.

GENERAL PURPOSES AND HISTORICAL BACKGROUND OF EDUCATIONAL EVALUATION

Definition and Description of Educational Evaluation

The Committee on Evaluation of the Adult Education Association of America (Brunner, 1959, p. 245) stated that the primary purpose of evaluation in education is to find out how much growth and change have taken place as a result of educational experiences. Burroughs (Lanning & Many, 1966, p. 311) stresses the importance of measurement in the evaluation process. Smith and Tyler (1942, p. 28) mention the following purposes of evaluation:

1. To validate the hypothesis upon which the school operates--the curriculum.

2. To provide a periodic check of the effectiveness of the school and serve as an indicator of points of improvement.

3. To provide a basis for the guidance of individual pupils.

Evaluation in the educational process, then, is the use of measurement, usually standardized tests, to determine the progress and growth of the individual student or the class group over a specified period of time.

History of Education With The Disadvantaged Adult

Though education has greatly improved in the United States, many people miss these educational opportunities or are not prepared to benefit from them. Most of these people are in a low socio-economic status and are considered to be culturally disadvantaged. Many migrant laborers, "mountain

whites", Negroes, Puerto Ricans, American Indians, and Mexican Americans have not had the same chances for personal progress as have most Americans. They have been disadvantaged by sub-cultures which did not prepare them for the demands and opportunities of modern life. (Educational Policies Commission, 1965, Pp. 1-2).

In 1964, the median years of school completed for adults twenty-five years and older, was 12.0 for whites and 8.9 for nonwhites (Baer, 1965, p. 969). Thompson (1964, p. 48) stated that the median educational level for the Indian population is even less, 5.0. This means, as illiteracy was defined by the Army during the last war as below a fifth grade level, that half of the Indian population is functionally illiterate.

Thompson (1964, p. 26) also states that Indian failures to hold jobs have been caused by the lack of knowledge of how to live in accordance with standards required in the average community or how to manage finances, rather than to lack of job skills.

The educational level of the average adult Navajo is well below that of the average United States adult, and he is also without the basic skills needed to live successfully in a non-reservation community such as Flagstaff.

The need for adult basic education programs for the culturally or socially disadvantaged adult has been recognized, and through the war on poverty programs, such as Manpower Development and Training Act and Job Corps, many adults and young adults are getting another chance at education and job training. Unfortunately, the Flagstaff school systems have no programs of adult basic education, whereby an individual who has left school before completion can continue his education, and perhaps receive a high school diploma. However, Indian adult education programs are becoming more prevalent in the Reservation areas, and many Navajos and other Indian groups are recognizing the value of and need for going to school themselves as well as sending their children to school. Much more work needs to be done in the area of adult basic education, but progress is being made.

History of Educational Evaluation Used In A Rehabilitation Setting

The majority of research studies on the educational evaluation of adults have been fairly recent in origin. One of the first attempts to evaluate educational attainment before and after a rather short educational experience was the Army Special Training Program during World War II (Lanning & Many, 1966, Pp. 59-60). Men found illiterate upon induction into the Armed Forces were tested and assigned to one of four groups, the groups corresponding to the first four grades in school. If a trainee started at the first level, he ordinarily finished the program in eight weeks. If he entered a more advanced section, less time was required. In order to graduate, the men had to make acceptable scores on tests in reading, arithmetic, and language ability. More than 90 percent of the trainees were successful.

A demonstration research project at Virginia State College entitled "Training the Hard-Core Unemployed" (Cooper, 1964) had as its purpose the devising of training methods for the semi-literate and literate unskilled worker. The men, primarily Negroes, in this project were enrolled in a general education class as part of their training program and were given the Gates Reading and Iowa Basic Arithmetic Tests to test achievement level at the beginning and end of the training period. The average gain in reading skills at the end of the Project was 1.87 grade levels over a six month period, and for those men with fewer than seven years of education, the gain was 2.13 grade levels.

The National Committee for Children and Youth has a continuous Youth Services Project in Baltimore, Maryland and Washington, D.C. (National Committee for Children & Youth, 1966). The purpose of this project is to help youth who have failed the Armed Forces screening tests. An educational program has been designed to prepare these youth to retake the tests and qualify for military service. The Armed Forces Qualifying Tests are the pre-test and post-test comparison instruments for the evaluation aspects of the project. In their September, 1966 report (p. 13), twenty-seven students had completed the educational class, and eighteen of these (66.6%) qualified for the military after completion.

At the Job Training Center in Lansing, Michigan, a program has been established for the hard-core unemployed. The purpose is to develop language skills, computational skills, and cultural understanding with the intention of preparing the trainees to successfully undertake vocational training (Michigan Catholic Conference, 1965). Evaluation by means of achievement tests (Botel Reading Inventory, S.R.A. Diagnostic Reading Test, California Achievement Test) was done when the trainee began pre-vocational training, repeated at the end of six months, and given again at the end of the client's training period. One of the tentative conclusions reached by this Project is that those clients functioning below a fourth grade level require a full 104 weeks of training at the Center before they are prepared to begin vocational training. No results are available as yet on significant increases in achievement level as a result of this training program.

A rehabilitation research project entitled "Vocationally Handicapped Montana Indians" was recently completed at Northern Montana College (Johnson, 1966). This project utilized the technical and vocational classes at the College to provide additional needed education for a select group of disabled Indians in the State of Montana. Even though the average grade completed for the Indian Rehabilitation Project client was higher(10.96) than that of the majority of the Montana Division of Vocational Rehabilitation Indians, most of the clients were in need of remedial education in order to handle the college classes. This remedial education was provided for the clients in the evenings. In the Montana Project Report no post-test information was given for achievement gains made while the client was in the Project.

Another project completed at Northern Arizona University (then Arizona State College) in 1965, was the Preparatory Training Project (Peterson, 1965). This Project grew out of the Navajo Rehabilitation Project, and was of shorter duration. The purpose of the Project was to upgrade the educational skills and social development of a select group of Navajo high school droup-outs. The Project attempted to raise the communication and mathematics skills of forty Navajo young men, as well as to develop the social skills necessary for urban living. Though achievement tests were used as part of the selection method

for the participants and as a means of determining actual functional level of achievement, no data is available as to increases in achievement level as a result of the Project.

CHAPTER II.

EDUCATIONAL EVALUATION AS USED IN THE NAVAJO REHABILITATION PROJECT

When the Navajo Rehabilitation Project staff first began its work with disabled Navajos, they combined a remedial Education Evaluation function with a personal and social adjustment evaluation function. The first Educational Evaluations done by the Project staff were primarily concerned with an assessment of the Navajo client's English language ability. It was found that the attained educational grade level in school did not accurately reflect the client's actual achievement level or his ability to read and understand English. The client's ability to understand spoken and written English was often several grade levels below his actual grade completed in school. For example, some of the clients who had completed ninth-tenth grade were reading at a fourth-fifth grade level of reading comprehension. Some evaluation of the client's abilities in the language area was considered valuable to the evaluation of the client's vocational potential.

As the Project evolved, the importance of the client's lack of education became increasingly apparent and the Educational Evaluation became more structured and academically oriented.

Thus, the Navajo Rehabilitation Project staff experimented with the usefulness of an Educational Evaluation as part of the total vocational evaluation procedure for the Navajo. An evaluation of the client's functional school achievement level was considered valuable in this total evaluation process because of the information it could give about the types of jobs the client was able to perform adequately. This evaluation was based on achievement test results and a more subjective rating by the Educational Evaluator. The area of Educational Evaluation did not become well

structured until the third year of the Project. The late development of this function was the result of changes in personnel. Each new evaluator had new or different views of evaluation, or new procedures and techniques which he wished to try. Changes were made in staff titles and duties as new needs were recognized by the Project personnel. Most of the statistical data in this report, therefore, are test results on clients who entered the Project only during its last two years.

The purposes of the Educational Evaluation at the Navajo Rehabilitation Project were as follows:

1. To ascertain the achievement level of the client as measured by standardized achievement tests, and compare it with the years of school he had completed;

2. To assess the functional English language ability of the client;

3. To assess the learning ability of the client;

4. To give the client a few weeks of basic instruction to help improve his academic skills;

5. To act as a check on the value of the intelligence tests given in the Psychometric Evaluation Area.

In addition to these basic purposes, the Educational Evaluation Area was also useful in gaining rapport with the client, noting his attitudes toward the evaluation and the staff members, and noticing physical handicaps that needed correcting, such as poor vision and hearing.

The Educational Evaluation made at the Navajo Rehabilitation Project differed from the usual educational progress evaluation because of its short duration. The entire vocational evaluation process originally took about eight weeks and was gradually shortened to six weeks, and then four to five weeks. Only a portion of this total time (approximately one-third) was actually spent in the Educational Evaluation Area. It resembled the usual educational evaluation situation in its design of a pre- and post-test situation, using a standardized achievement test as the measuring device.

CHAPTER III.

EVALUATION PROCEDURES

The Educational Evaluation consisted of making a preliminary assessment, using a detailed achievement test battery, then engaging the client in remedial instruction, and re-testing him with the achievement test battery.

When the client entered evaluation, he was placed in the Educational Evaluation Area on a half-day basis. However, the client was also given psychometric tests during this time; thus, he was not continuously in the Educational Evaluation Area.

The first step in the Educational Evaluation procedures was a brief interview with the client to gather background information such as name, age, disability, number of years of formal education, and place of formal education. If the client needed an interpreter in order to communicate with the Evaluator, a note was made of this. If the client could speak English, his verbal ability was noted (good, fair, or poor). Also noted were his degree of accent, and the difficulty he presented to those attempting to understand his speech. During this first interview, the Evaluator explained what the client would be doing in the Educational Evaluation Area, and the purposes of such an evaluation.

The next step in the preliminary assessment of the client was the Wide Range Achievement Test (Jastak, 1946). This test gives separate scores for reading, spelling, and arithmetic. Most of the clients could take this test, since it begins with first grade material, such as writing one's name correctly, recognizing the letters of the alphabet, and simple addition problems. The Wide Range Achievement Test thus gave the Evaluator the approximate grade achievement level of the client.

If the client received at least a 3.0 grade placement score in reading on the Wide Range Achievement Test,

he was then given the Iowa Tests of Basic Skills (State University of Iowa, 1956), a more complete test of the client's school grade achievement level. The Iowa is designed for use with students in grades three through nine, and takes approximately five hours of testing time. Though the test has norms for children rather than adults, the use of the test was considered useful in gaining information as to the academic abilities exhibited by Navajo Rehabilitation Project clients. For example, low achievement in arithmetic or reading might delete certain job possibilities from the client's choices unless these difficiencies could be remedied. The areas tested by the Iowa Tests of Basic Skills are vocabulary, reading comprehension, language skills, (including spelling, capitalization, usage, and punctuation), work-study skills (including map reading, reading graphs, and tables, and knowledge and use of reference materials), and arithmetic skills (concepts and problem solving). A composite grade placement score was computed as the average of the five tests.

During the first few days of evaluation, the client was also given the Gilmore Oral Reading Test (Gilmore, 1951). This test was used in an experimental manner in the Educational Evaluation Area at the Navajo Rehabilitation Project. Form A of the Test was used to determine the oral reading comprehension level of the clients (traditional use of the test). Form B of the Test was administered as an oral listening test. The assumption made was that if the clients listened to the graded paragraphs read to them and then answered the comprehension questions that went with each paragraph, and if they were reading at their mental age level, their Form B score would be comparable to their oral reading score. If the person read poorly, but understood English well, one would expect his oral listening score to be much higher than his oral reading score. If he was English language handicapped, both of his scores would be lower than his present grade or last grade completed in school. In any event, his oral listening comprehension score should be an indicator of his actual ability to comprehend spoken English. When a client's oral listening score is well below his oral reading score, other problems such as auditory discrimination, emotional problems, inattention, etc., should be investigated. However, the use of the Gilmore Oral Reading Test as an oral listening test was a new use for it, and it may not measure what the

theory tentatively assumed, since time did not allow testing the validity of this theory.

After the client had completed the achievement testing, he was ready for remedial instruction. When the idea of comparing pre-test and post-test achievement scores was initiated, the length of remedial instruction time was set at six weeks. It was believed that in six weeks the Evaluator could expect moderate gains in achievement if the client was capable of benefitting from such instruction and had a positive attitude toward instruction. The Educational Evaluator, however, continually had to shorten this period to five, four, three, and finally two weeks because one of the aims of the Project was to shorten the total amount of evaluation time for each client. With success in shortening the test battery and the knowledge gained in the evaluation of Navajo clients resulting from Project experience, the Navajo vocational evaluation could adequately be completed in a shorter period of time. This conclusion was valid in general, but did put pressure on the Educational Evaluator who was charged with giving the clients as much time as possible to improve their basic educational skills. Even with the shortened time period, a fairly accurate estimate of learning ability could be made by the Educational Evaluator; however, significant achievement score gains became more difficult to accomplish as the period of instruction was shortened. Evidence in support of this statement is presented in the chapter on "Results" in this paper.

In the remedial instruction period, emphasis was placed on improving basic skills in reading, language, and arithmetic. The test information indicated to the Evaluator which learning materials the client was ready to work with. Emphasis was placed on improving the client's skills in areas showing the greatest weakness. Also, if the client had a preference for learning skills in certain areas, more time was spent on these areas of interest. It was believed that the client would learn more and be more interested in what he was doing if he could study subjects of interest to him.

At the finish of the Educational Evaluation, the client was again tested on the alternate form of the <u>Iowa</u>

Tests of Basic Skills. His achievement test scores on both forms were then compared for significant differences. In assessing significant differences, the score had to be significantly different from what could be expected from chance variation. On the Iowa Tests of Basic Skills the standard error of measurement varies for each subtest, test total, and composite score. The alternate forms of the test give equivalent grade placement scores; thus, chance differences in two thirds of the cases, when students are re-tested, will be within the limits set by the standard error of measurement. Doubling the score differences expected by the standard error of measurement would include more than 95 percent of the range of score variation at different testings. Thus, if a score difference of ± .2 is the standard error of measurement, a difference greater than ± .4 would not be expected to occur by change alone 95 percent of the time, and could be considered as a statistically significant increase or decrease in scores. A decrease in test score may be the result of chance, lack of motivation, poor test-taking attitude, fatigue, illness, or related factors. A significant increase in score, however, may be attributed to an increase in achievement level, resulting from intervening learning experiences. Other factors also may play a part in an increase in achievement score, such as increased test-taking knowledge, reviving of unused skills, difference in number of test items completed, increase in motivation, etc. The standard error of measurement was fairly large for some of the subtests (± .2 to ± .8), less for the test totals (± .2 to ± .5), and fairly small for the composite score (± .1 to ± .2). Thus, on different testings, subtest scores may vary considerably, but composite scores are much more stable.

Our ideal evaluation procedures, then, were to use the Wide Range Achievement Test and the Gilmore Oral Reading Test as preliminary assessments of achievement level and the Iowa Tests as a more complete pre-testing device. Remedial instruction was given for several weeks, and then the client was post-tested on an alternate, equivalent form of the Iowa Tests. Significant increases in achievement scores were considered an indication of a good learner. Through the observations made and the work completed in the classroom, the Evaluator gained other valuable qualitative information about the attitudes

and abilities of the client that could not be ascertained through the measurement of achievement gains or losses.

The ideal evaluation procedures could not be used with all of the Navajo Rehabilitation Project clients. Most, but not all, of the clients could take the Wide Range Achievement Test. One advantage of the Wide Range Achievement Test was that the client could exhibit his arithmetical computational abilities even though he spoke no English, since minimal reading is required on this section of the test. If the client spoke no English at all, he was not usually able to take any of the standardized tests given as part of the educational evaluation. The evaluations of these clients had to be made primarily from data collected in working with the individual in the classroom; and was, thus, more subjective in nature. The Dailey Language Facility Test (Dailey, 1965) was sometimes used to assess the language age of the client. This experimental test consists of a set of pictures; each picture is presented separately and the client is told to make up a story about the picture. The story which the client tells is later scored to determine the language age of the client. This Test could be administered in Navajo by using an interpreter. The interpretations of the client's language ability made from this test had to be done cautiously with Navajo Rehabilitation Project clients, since these clients usually described the picture, but could not tell a story built around the picture. Their usual inability to tell a story might be a result of shyness or not understanding the directions properly.

The ideal evaluation procedures were also modified with clients who scored below a third grade level in reading on the Wide Range Achievement Test and the Gilmore Oral Reading Test. Their testing was usually finished at this point, since they read too poorly to take the Iowa Tests. The Dolch Basic Sight Vocabulary Cards (Dolch, 1949) were often used with clients who could recognize some written English. The ratio of words pronounced correctly to the total number of words was calculated and changed into a percentage. This "score" gave an indication of what reading material, if any, the client was ready to handle. The remainder of their evaluation was based on work in the classroom.

Some of the clients did not stay in the Project long enough to complete the full Educational Evaluation. These were the clients found non-feasible before they had finished evaluation, or those who had completed most of the evaluation and needed to leave the Project as soon as possible for personal reasons. Since the Educational Evaluation was usually the longest part of the Navajo Rehabilitation Project evaluation, it often had to be shortened.

CHAPTER IV

GENERAL DESCRIPTION OF NAVAJO REHABILITATION PROJECT CLIENTS

The Navajo Rehabilitation Project rendered evaluation services to 117 clients during its existence. Eighty-eight of these clients were male, while the remaining twenty-nine were female clients. The clients' ages ranged from sixteen years to over fifty years. The majority of the clients were under thirty-five years of age; the most frequent age category was from twenty-seven to thirty years of age.

All clients evaluated had either a physical or mental handicap. Most of the clients were physically disabled, but there were a number of younger clients referred who were evaluated to assess possible mental retardation.

The educational attainment of the clients varied widely. There were twelve clients who had had no formal education, while seventeen clients had completed the twelfth grade. Three clients had been to college for a year, and one client was a college graduate. The most frequent educational level was fifth grade, and the mean educational level for the total client group was 6.6. Thirty-three clients had been to school less than five years.

The Table on page 17 is a breakdown of the types of schools attended by Navajo Rehabilitation Project clients. These categories are not necessarily mutually exclusive.

The Table indicates that most clients attended schools managed by the Bureau of Indian Affairs. These schools are located both on and off the reservation, and are usually boarding schools or have a dormitory available where students are housed.

Most Navajo Rehabilitation Project clients had been to school, but had quit school before completion. The majority of clients were greatly under-educated, and this lack of school experience and lack of academic achievement made it difficult for them to find good jobs.

TABLE I

SCHOOLS ATTENDED BY NAVAJO REHABILITATION PROJECT CLIENTS

Type of School	Number of N.R.P. Clients Who Attended
Bureau of Indian Affairs Schools	
Grade School (including 5-year special program students)	56
High School	17
Public Schools	
On the Reservation	15
Off the Reservation	33
Mission Schools	
High Schools on Reservation	0
Grade Schools on Reservation	2
Off the Reservation	8

CHAPTER V

THE CLASS SITUATION AND FORM OF INSTRUCTION

Clients usually entered the Project individually, rather than in a group, partly because of the transportation difficulty on the Reservation. The staff finally realized it could not expect a group of clients to arrive at the same time. Also, many clients would postpone their evaluation because they could not leave home immediately. It was also found that some clients could complete evaluation more quickly than others. These factors combined to make it impractical to await the arrival of one group at a time. Thus, Project personnel decided to bring in a new client as soon as an old one left. Therefore there was usually much time overlap of clients; at any given period some clients were completing evaluation, some were in the middle of evaluation, and others were just beginning evaluation.

This ever-changing evaluation group did affect the Educational Evaluation Area, since at times there were people operating at approximately the same achievement level who could be taught as a group. It was difficult, however, if one client was finishing evaluation, and another beginning. The Educational Evaluator noted that if a small instructional group were formed and some of the group members finished evaluation before the others, it was difficult to keep the remaining group member(s) interested in instruction. This fluctuating group was not often a serious disadvantage because the majority of the instruction was individualized. Individual instruction was given frequently because groups were small, varying from one to eight clients at a time. The usual group size was four to six clients. Group work was done where possible, but with people operating at varying levels of understanding, it was better to work with each client and his individual needs. For example, at one time there might have been a client who spoke little or no English, one who was at a beginning read-

ing level, and several who were operating at higher levels of achievement.

Obviously, clients at a lower achievement level needed much more instruction time, and could not do much studying on their own. Clients operating at a higher level could be given instruction; then they could attempt by themselves some work sheets to test understanding of the instruction. Later, the Instructor would go over the material with the client, correcting errors and giving assistance when necessary.

Remedial instruction centered around reading, language, and arithmetic. Since there are practically no learning materials prepared specifically for Navajos, a wide variety of materials were used in instruction. An exception is the Wycliffe Navajo-English materials which are designed to teach the reading of Navajo.

Clients who spoke little or no English and were operating at a low level of basic skills were given instruction in oral English, basic arithmetic, and such skills as telling time, counting money, and making change. Inability to speak adequate English did not always mean the client was also unable to do such things as tell time, and count money, but frequently a low English level was accompanied by a general lack of off-Reservation experiences and skills. The Navajo Rehabilitation Project Navajo interpreter was used as much as possible in explaining new concepts to the non-English speaking client, and he was used as an assistant instructor in working with these lower achieving clients. The materials used with these clients were often concrete objects they could handle or hold. For instance, play money was used in learning to count money and make change. A place-value board with movable disks was used to explain the number system. A drawing of a large clock, with movable hands, was used to teach the clients how to tell time. The Cuisenaire Rods (Cuisenaire Co. of America) [colored wood rods used to explain mathematical concepts] were tried with these clients, but not used extensively.

In practicing oral English, Mitchell's (1957) Beginning American English was used. With this book sentence

patterns, rather than mere vocabulary words, are practiced; pictures are used throughout the book to facilitate the student's understanding, and a minimum of interpretation is needed. Transfer from the text to the real world was facilitated by discussing objects in the classroom and by patterning class conversation after the sentence patterns in the book.

The Wycliffe Navajo-English reading materials were used in several ways--to compare Navajo and English oral sentence patterns, to help the Navajo understand English sentences, and to give the student some skill in reading Navajo in the hope it would facilitate the learning of reading English. The latter use was not preferred by the staff, since most Navajos cannot read their own language; and it appears to be just as difficult for them to learn to read Navajo as to learn to read English. Furthermore, Navajo was not a written language, and little has been adapted to the "synthetic" written Navajo. It seemed more useful to concentrate on English even if the client was not prepared to begin reading in English. Objectivity demands the mention that some instructors, especially the people who have developed and promoted the Wycliffe series, feel that the best method of teaching Navajos to read is to use the reading of Navajo as a bridge to the reading of English.

If the client was fairly proficient in oral English, he was started in elementary adult readers. These readers had a content that was written to interest adults; yet, the reading skill required was low. Phonics drills often accompanied the client's introduction to reading.

For the more advanced readers, actual skill level was ascertained through achievement test scores, and materials were assigned accordingly. The Reader's Digest Skill Builder's and Advanced Skill Builder's (Reader's Digest Services, 1958) for levels one through eight, were used extensively. This reading series is based on stories from the Reader's Digest, but written at varying levels of reading skill. The majority of the clients seemed to enjoy reading these books. At the end of each story, there are a series of comprehension questions about content, vocabulary, and unusual sentence structure or word phrasings. Completion and discussion of these exercises

gave an indication of how well the client understood the reading.

In the language and grammar area, several books were used, including I Want to Learn English (Smith & Wilbert, 1965), for the lower level reader, and Building Better English (Greene, 1962), for the more advanced clients. No matter which book was used, concentration was in the areas of verb usage, capitalization, and punctuation. The language area was a difficult one for the Navajo clients, as most of them used rather poor grammar and sentence structure. It appeared to be very difficult to improve skills in this area. One client raised her achievement scores moderately in this area after a couple of months of instruction, but did not improve after this, though instruction was continued for several more months.

In the arithmetic area, other than work with handling money, arithmetic work sheets and various text books and work books were utilized at different levels of achievement. In explaining arithmetic concepts to the clients, the instructor hoped to increase the client's understanding of arithmetic as well as to increase his computational skills. The client's ability level was obtained from test results, and work in arithmetic was started with a review of skills which the client had known but was not sure of at that time. New skills were then built on the solid foundation of the old.

In all the classwork done by the client, he was allowed to take as much time as he needed to complete an assignment. No studying outside of class was required, but the client could take class materials to the dormitory if he wished. The Instructors tried to create an atmosphere in which the client would feel comfortable, be able to work at his own rate of progress, and remain interested in improving his educational skills.

Most of the Navajo Rehabilitation Project clients appeared to enjoy the Educational Evaluation Area, and were interested and diligent students. There were exceptions, of course. Some of the younger clients who had had recent unhappy experiences in school tended to be disinterested and

even uncooperative at times. Other clients, who had been out of school a long time, or who had not had much education, found formal learning a difficult task and often became discouraged. Increased encouragement and praise on the part of the Instructors was instrumental in improving the client's attitude and desire to keep trying.

One of the major questions raised by the Educational Evaluation Area is concerned with the form of instruction needed by the "typical" Navajo Rehabilitation Project client. Were the areas stressed in the Educational Area the ones most needed by the clients? Perhaps this question can best be answered by saying that the client was receiving instruction in needed areas, but that what was taught was only a small cross-section of the spectrum of needs exhibited by the clients. During the short period of remedial instruction, attention had to be focused on areas in which there was the greatest chance of finding significant improvements. Areas were also needed in which these improvements could be measured by testing devices to help determine the learning ability of the client.

As well as the formal instruction given to the client in the classroom situation, the client was expected to be in the classroom at a specified time each day, and to let the Instructor know when he was going to be absent from class. The client was also presented the idea that education was valuable and useful, and that an increase in knowledge and skills was an important step in finding better employment. In this respect, the Instructors were trying to teach some of the values of the dominant United States culture, though in the last two years of the Project, this instruction was more subtle than overt. It was not expected that Navajo clients could or should change their way of thinking, but if they could incorporate some of the behavior necessary for job success such as punctuality, courtesy, and reliability, their chances for successful employment would probably increase considerably.

CHAPTER VI

EDUCATIONAL EVALUATION REPORT

In the Navajo Rehabilitation Project, gathering information about the clients was a continuous process. Even before the client entered evaluation, a general information folder was made for each client. The Educational Evaluator used the information in this folder to learn something about the client, his disability, and his social and educational history.

When the client entered the Educational Area, a folder specifically for this area was started. A summary assessment sheet was placed in the folder to be completed as the client took the achievement tests and began remedial instruction. A daily record was maintained of the client's progress in the Educational Area. The instruction he had received and his reactions to this instruction were included here, as well as notes concerning the behavior and attitude of the client.

As the client finished his achievement tests, the results were noted on the summary assessment sheet, and were compared with his educational background. The Evaluator wanted to know if the client was under or over-achieving, and the reasons for this under or over-achievement. The age of the client, and the length of time he had been away from school were also considered.

A comparison of the client's achievement test scores on the two forms of the Iowa was made, and significant gains or losses studied in more detail. If the client made significant gains on the test he was considered to be a better learner or more motivated to learn than a person who made no gains or who made significant losses. These results had to be studied carefully, however, because a client who had recently been in school, or who had received a greater amount of education would likely gain less or nothing over a short

period of time, since his skills were already fairly adequate or of recent experience. Clients who were severely under-educated or who had forgotten a great deal of what they had learned in school would probably be the most likely to gain significantly in achievement level with a brief period of remedial instruction.

The Educational Evaluation report on each client included background information such as age and years of school completed, achievement test scores, description of the client's class work and behavior in the classroom, a comparison of pre-test and post-test results from the Iowa Tests, and an estimate of the client's learning ability. If the client was seriously under-educated, and had shown good motivation and ability to learn in the classroom, he was usually recommended for further adult basic education.

The Educational Evaluation report was one of several reports utilized in the total vocational evaluation of the client. Other reports included the Psychometric Evaluation, the Pre-Vocational Laboratory Evaluation, and the Social Evaluation. Information from the Educational Area was useful in establishing the current achievement level of the client, his learning ability, and his ability to benefit from further adult basic education.

CHAPTER VII

RESULTS OF THE EDUCATIONAL EVALUATION AREA

Areas of Investigation

One of the purposes of the Educational Evaluation was to investigate some of the relationships between achievement test results and other relevant factors. This investigation was done statistically, where possible, by means of rank-order correlation coefficients. The Evaluator wanted to know not only whether the clients could make achievement test score gains, but also what relevant factors contributed to the gains that were made. More specifically, the areas of investigation were as follows:

1. The relationship between years of formal education and intelligence measures, including the Wechsler Adult Intelligence Scale, the Revised Army Beta Test, and the Raven Progressive Matrices.[1]

2. The relationship between years of formal education completed and grade placement on the Iowa Tests of Basic Skills.

3. The relationship between grade placement on the Iowa Tests of Basic Skills and intelligence measures.

4. The ability to make achievement test score gains after a short period of remedial instruction.

5. The relationship between gains on the Iowa Tests of Basic Skills and intelligence measures.

---

[1]These tests were given in the Psychometric Evaluation, and more detailed discussion of the use of these tests with Navajo clients is available as a separate Navajo Rehabilitation Project monograph.

6. The relationship between gains on the Iowa Tests of Basic Skills and years of formal education completed.

7. The relationship between gains on the Iowa Tests of Basic Skills and client age.

8. The relationship between gains on the Iowa Tests of Basic Skills and the year the client left school.

9. The relationships of different achievement tests with each other.

Results Of The Investigation

All of the specific correlations discussed in this "Results" section were significant at at least the .05 level of confidence.

1. All of the verbal tests on the Wechsler Adult Intelligence Scale correlated positively with years of formal education. These correlations ranged from .36 to .73. It is interesting to note that some of the performance measures on the Wechsler also correlated positively with years of school completed. These performance measures were Digit Symbol & Block Design. As would be expected, the correlation of the amount of formal education with the Wechsler Verbal I.Q. was considerably higher (.67) than with the Performance I.Q. (.32). The Beta Total score and the Raven score also correlate positively with years of school, though these correlations are not high (.31 and .38). These correlations were significant at the .05 level of confidence.

2. A positive relationship was found between years of formal education and achievement scores on the Iowa Tests of Basic Skills. The correlation for the composite score on the Iowa was .76, and significant at the .01 level of confidence.

   Even though positive correlations were found, it was noted that a considerable discrepancy existed between

grade completed in school and grade placement on the achievement tests. One of the general characteristics of Navajo clients was that grade placement scores calculated from the achievement tests were well below actual grade completed in school. For a group of fifty Navajo clients who were given achievement tests, their average grade placement on the tests was 5.0, while their average grade completed in school was 8.0. The difference between the means was significant at the .01 level of confidence. Appendix E compares the clients' grade completed in school with their grade placement on several achievement tests.

3. A number of significant (at least .05 level of confidence) positive correlations were found between the intelligence measures and grade placement on the Iowa Tests of Basic Skills. A table of these correlations can be seen in Appendix I. These correlations include performance, as well as verbal, measures of intelligence. It appears that intelligence tests for the Navajo group are, to a great degree, measuring learning.

4. Of the fifty clients who were evaluated after September 15, 1965, twenty-two were given both the pre-test and post-test on the Iowa Tests of Basic Skills. The remainder of the clients either could not read well enough to take these tests, or else had left before their evaluation was complete.

Eleven of these twenty-two clients (fifty percent) made significant composite score gains on the second testing. Their average composite gain was .6 of a year. Twenty of the clients made significant gains on two or more of the subtests. In Appendix C and H a comparison is made of the clients' scores on both forms of test. Appendix H indicates where significant gains were made. When it is remembered that these clients received only a few weeks of remedial instruction, their gains are quite encouraging. Most of the clients did benefit from the remedial instruction, and were able to improve achievement test scores in the post-testing situation. Of course, some of the clients made more improvement than others, and two clients showed no improvement at all.

Using achievement test scores as a criterion, those who made gains in the composite score can be considered to have benefitted the most from the remedial education experience. One factor that affected the ability to make achievement score gains was the length of the educational evaluation period.

Using June of 1966 as a dividing line (at this time, evaluations began to be of shorter duration), this group of twenty-two clients can be divided into two equal groups of eleven. Those who were in evaluation before June, 1966, had a longer period of remedial instruction, in general, than the second group. Of the first group, nine made significant composite score gains and two did not; of the second group, two made significant gains while nine did not. Using a chi-square test, this difference between early and late groups is significant at between the .02 and .01 levels. It appears that there is evidence to support the hypothesis that a very short period of remedial instruction (less than ten days) is much less effective in producing achievement gains than a slightly longer period (ten to thirty days).

5. There were several significant correlations (.05 level of confidence) relating some of the intelligence measures with gains in achievement. Gains in the total language achievement area correlate negatively with some of the intelligence measures, including the WAIS Information subtest, the WAIS Digit Span subtest, the WAIS Vocabulary subtest, the WAIS Verbal Score, the WAIS Picture Completion Subtest, the WAIS Total Score, and the Beta Total Score.

   Those students who performed poorly on the intelligence measures made the most significant gains in language achievement. However, there were also significant positive correlations between the Raven and two of the Iowa tests-- vocabulary and usage. Those who performed well on the Raven made the most gains in vocabulary and usage. There is also a positive correlation between WAIS Digit Symbol and a gain in the Iowa Arithmetic Problems, and a positive correlation between WAIS Similarities and a gain in the Iowa Reference Materials subtest. A Table of all significant correlations is in Appendix J.

6. No significant relationships were found between years in school and gains on the Iowa Tests of Basic Skills.

7. Client age was found to correlate negatively (.05 level of confidence) with a gain in Arithmetic Problems and positively with a gain in Reference Materials and Total Work Study Skills. The older clients did not make gains in Arithmetic Problems as well as the younger clients. One reason for this difference was that the older clients scored higher on the pre-test in Arithmetic Problems, indicating they knew more arithmetic than the younger clients and, since they were at a higher achievement level to begin with, they would be less likely to make significant gains in this area.

8. It was also found that clients who had been out of school most recently gained the most in Arithmetic Problems, and gained the least in Graphs and Tables, Reference Materials, and Total Work-Study Skills. This corroborates our previous observation concerning client age and gains on the achievement tests, since in general, the oldest clients have been out of school the longest.

9. In investigating the tests used in the educational evaluation, significant correlations were found for the Navajo group, between the following achievement tests:

   The Wide Range Reading Test correlated highly (.82) with the Iowa Reading Comprehension Test (.01 level of confidence).

   The Wide Range Spelling Test correlated highly (.88) with the Iowa Spelling Test (.01 level of confidence).

   The Wide Range Arithmetic correlated .72 (.01 level of confidence) with the Iowa Arithmetic concepts, .49 (.05 level of confidence) with the Iowa Arithmetic Problems, and .66 (.01 level of confidence) with the Iowa Arithmetic Total.

   The Gilmore Oral Reading Test correlated .73 (.01 level

of confidence) with the Wide Range Reading Test, and .60 (.05 level of confidence) with the Iowa Reading Comprehension test.

One interesting correlation was found between scores on the Wide Range Reading and on the Wide Range Spelling Tests. They correlate .95 (.01 level of confidence) with each other, indicating that they must be measuring almost the same skills for the Navajo client group.

Discussion of the Results

The investigations made in the Educational Evaluation indicated that measures of intelligence and measures of learning or achievement were definitely related to one another. This relationship would be expected for verbal measures of intelligence. In the performance measures of intelligence, where it is assumed that lack of formal education will not as greatly penalize the individual, performance measures of intelligence are also correlated with the amount of formal education of Navajo clients. This correlation indicates that a lack of education penalized the Navajo Rehabilitation Project clients on intelligence tests.

Navajo Rehabilitation Project clients, in general, also did not achieve scholastically as well as their non-Indian peers. They were usually functioning at an achievement level several grades below their completed grade in school. The probable reasons for this discrepancy are language handicaps and cultural differences. The Navajo student from the Reservation areas probably needs many extra educational experiences and language instruction before he is prepared to compete in school with non-Indian students.

In investigating the ability to make gains in achievement after a short period of remedial instruction, it was found that most of the clients could make some significant gains in achievement level. In an attempt to find specific reasons for extensive gains on the part of many clients, a study was made of the relationships between achievement score gains and years of school, gains and intelligence test scores, gains and client age, and gains and the year the client left school. For measures of language achievement, clients who

made the most significant gains did poorly on tests of intelligence. These clients were probably functioning at a low basal level in language ability, had more opportunity to gain and therefore, could make gains more quickly than their more educated associates. Client age and the number of years out of school were correlated with gains in some achievement areas. The older clients and those who had been out of school for a longer time, made less gain in arithmetic, but made more gains in the work-study skills area.

CHAPTER VIII

SUMMARY OF THE EDUCATIONAL EVALUATION

The Educational Evaluation was established to evaluate the educational abilities of Navajo Rehabilitation Project clients. It was hypothesized that language ability and other academic skills would be important in determining the vocational potentials and abilities of the Navajo Rehabilitation Project clients.

It was found in the Educational Evaluation that most Navajo Rehabilitation Project clients were operating scholastically several grades below their actual grade completed in school. The average grade completed by the clients was sixth grade, and some of the clients had no formal education. As a group, the clients were severely under-educated by formal standards. It was realized that the majority of the Navajo clients needed further adult education. The fact that most of the clients made achievement gains at the end of their evaluation period indicated that they could benefit from remedial instruction. Thus, the Navajo Rehabilitation Project Educational Evaluation was instrumental in indicating the need for an adult basic education program. The Department of Rehabilitation has since established the Pre-Vocational Education Program to provide instruction in academic and social skills. Clients classified as culturally or socially deprived may enter this program for a six months period.

The Educational Evaluation also indicated a need to include achievement tests in the psychometric battery of the Rehabilitation Department since grade completed in school is not a valid indication of the actual achievement level of the client.

The Educational Evaluation was useful for research purposes, and appeared useful in corroborating impressions obtained from other Evaluation Areas; but it was decided that the Educational Evaluation was not essential to the usual

vocational evaluation process. Nonetheless, it was educationally useful for the Navajo Rehabilitation Project clients, and indicated some areas for further work in adult education.

APPENDIX A: Case Study #1, Mr. R. J.

Mr. R. J. was a thirty-four year old paraplegic client who had only completed the third grade. He could speak English well. His scores on standardized achievement tests indicated that R. J. was operating at a fifth grade level of achievement.

This client was highly motivated during his evaluation period, and seemed to be of average or above average learning ability. He stated a desire to continue his education, and the Instructor felt that he could benefit from an adult education program with emphasis on instruction geared to his own needs and the hope of eventually passing the General Educational Development Test (high school equivalency test).

Mr. R. J. received excellent recommendations from each of the evaluation areas; it was generally felt by the staff that he possessed above average ability and potential for successful rehabilitation. It was recommended that he enter the Pre-vocational Education Program for a six-months period with emphasis on improving specific academic skills.

R. J. was in this program a number of weeks, and became increasingly dissatisfied with the Program and the Rehabilitation Center. He felt he was not getting what he wanted, and was also worried about his family in Gallup, New Mexico. The staff tried to persuade R. J. to stay in the Program, but he said he needed to go to work. He left the Project, and his current status is unknown.

Mr. R. J. was a disappointment to the Navajo Rehabilitation Project staff, perhaps because he seemed superior in abilities and motivation. We put our hopes in him, and he could not live up to them. This was a case that we perhaps should have handled a bit more carefully. The Instructor and the other Navajo Rehabilitation Project staff members had built up his faith in his abilities, and we may have given him the impression that he could easily study for and pass the General Educational Development Test. When he began his Pre-vocational Education Program and looked at the level of reading and math required to pass the test,

he became discouraged and tried to push himself too fast. The task before him seemed overwhelming, and he probably felt that it was too much for him to handle. With family problems added to his personal problems, there was not enough incentive for him to remain in the Program.

A P P E N D I C E S

APPENDIX A: Case Study #2, Miss M. L.

Miss M. L. was a twenty-six year old single Navajo when she entered the evaluation. She had completed the tenth grade in Canada where she was involved in a serious automobile accident. Her legs were paralyzed, and she had to spend several months in the hospital. She did regain the use of her legs and applied for the Bureau of Indian Affairs Employment Assistance Relocation Program. She was trained as a nurse's aide, and worked as one until her right ankle started to bother her. She returned to the hospital for a fusion of this ankle to increase support for standing and walking. This surgery did not heal properly and a re-fusion had to be performed. The client could not return to work as a nurse's aide because of difficulty with walking and pain in her ankle after walking or standing for any length of time. When M. L. came to the Navajo Rehabilitation Project, she was interested in becoming a medical records librarian or a secretary.

Preliminary achievement testing in the Educational Evaluation Area indicated that Miss M. L. was performing at a ninth to tenth grade level of achievement, which was quite remarkable considering she had only completed the tenth grade, and had been away from school about seven years. The Instructor felt that Miss M. L. might pass the General Educational Development Test (high school equivalency test), and remedial instruction was started with this goal in mind. Speed reading techniques were stressed, as well as vocabulary and attention to directions and details. She was also given instruction in arithmetic word problems.

Miss M. L. was highly motivated to pass this test since she needed a high school diploma to enter business college. She worked diligently for a three-week period, taking study materials back to the dormitory in the evenings. When the Instructor felt she was prepared to take the test, arrangements were made and the test scheduled.

M. L. passed the GED test, and applied for her high school equivalency diploma. She was still interested in work along secretarial lines, so recommendations were made

for M. L. to attend a business school. She enrolled in a business college in Dallas under the auspices of Bureau of Indian Affairs Employment Assistance and successfully completed a nine-months course in business machines and keypunch operation. At the present time, she is successfully employed as an IBM Keypunch Operator in Dallas, Texas.

This client undoubtedly had the ability and motivation to succeed, but the help she received in preparing for the high school equivalency examination was thought to be a significant contribution to her successful rehabilitation.

APPENDIX A: Case Study #3, Mr. H. J.

Mr. H. J. was a twenty-four year old Navajo when he was evaluated at the Navajo Rehabilitation Project in November of 1966. He had a dragging foot and weakened arm as a result of cerebral palsy. Mr. H. J. had no work history, and was residing with his parents at Lukachukai, Arizona, on the Navajo Reservation.

This client had completed a Five-Year Special Program at the Intermountain School in Utah. H. J. said that he had learned to speak English while at school, and his English was adequate for simple conversations, though heavily accented. His educational skills were extremely low-- he could not read, could write only his name, and could add only simple numbers. His writing was practically illegible.

Testing in the psychometric area showed that Mr. H.J. was operating in the handicapped range of intelligence in both verbal and performance areas. His scores, however, were considered to be depressed because of low English communication skills, cultural differences, and poor coordination.

Mr. H. J. was in the Educational Evaluation Area several weeks. When he first began evaluation, he was shy and ill at ease. He was self-conscious and not overly cooperative. He felt that some of the classwork was "baby work" and did not want to do it. Since H. J. wanted to begin reading, the Instructor started the client on simple reading even though she did not feel he was ready to begin reading. However, H. J.'s attitude improved greatly as instruction progressed, and he became friendly and eager to work. His progress was slow, but he did learn some sight words, practiced his penmanship which improved slightly, and made fair progress in addition and subtraction. His difficulty in concentration and short memory span seemed to indicate possible organic brain damage associated with his cerebral palsy.

The functioning and improvement shown by this client indicated that he could benefit from remedial education, social adjustment, training, and physical therapy. He was

referred to the Pre-Vocational Education Program and the Physical Therapist for further services in these areas, and is still enrolled in this Program. His attitude and progress have been good, and the Rehabilitation Staff hopes to successfully place this man when his training period ends.

APPENDIX C: Sample Of An Educational Evaluation Report

Client: Mr. P. L.

Date: October 24, 1966

Evaluator: Carole Gaspari, Instructor

EDUCATIONAL EVALUATION

Mr. P. L. is a twenty-one year old Navajo-Zuni who was referred for rehabilitation services because of social behavior problems and possible mental retardation. He speaks English fluently with no accent. He is not bi-lingual.

When P. L. entered evaluation, he was given the Wide Range Achievement Test. His grade placement scores were all between first and second grade levels. On the Gilmore Oral Reading Test P. L. scored below first grade level on both the oral reading and the listening forms of the test. His listening comprehension level seemed unusually low, considering that P. L. has good verbal ability and can carry on ordinary conversations quite adequately.

P. L. was in the classroom about three weeks, and worked on building up his reading, writing, and arithmetic skills. P. L. learns slowly, and needs much individual attention. He seems to require the psychological support of having someone interested in him and his accomplishments. He does seem to learn adequately when encouraged. I noticed that when I was busy working with other clients, P. L. had a tendency to just sit and do nothing, or else to keep asking for help so that my attention would be drawn back to him. Also, the client seems to have had the frequent experience of people telling him he was stupid and incapable of learning. This has led to his easy discouragement when he is confronting something that is difficult for him. He is able to overcome this feeling if given assistance and encouragement from the instructor.

P. L. is making good progress with his reading and has

shown improvement in his writing skills. He has worked on number values, and simple addition and subtraction. He has trouble with arithmetic and needs patient instruction in this area. He has a fair comprehension of money values, but needs more work in this area. He learned how to tell time fairly well, which he could not do before instruction (he could tell time on the hour, but that was all.)

Summary: P. L. seems to be an excellent example of the educationally retarded and culturally deprived individual. He needs an adult basic education program, which should include remedial education with emphasis in the basic skills as well as socialization activities and instruction in physical hygiene. This client seems capable of normal learning as long as someone takes a personal interest in his progress and keeps encouraging him. If P. L. is ignored or left to work alone, he wastes time and gets little accomplished. He will require much individual attention until he gains a better grasp of the basic skills,and gains also a greater confidence in his abilities.

APPENDIX D: List of Educational Books and Materials Used at the Navajo Rehabilitation Project

Alves, H., et. al., Modern Practice Book in Arithmetic - Book 4, Steck Co., Austin, Texas, 1955.

A basic arithmetic work book for the intermediate level student.

California Test Bureau, Lessons for Self-Instruction In Basic Skills, Monterey, California, 1963.

A series of programmed learning materials in reading, following directions, grammar, and arithmetic. The reading level for these materials begins at about the third grade level and continues to more advanced levels. Very suitable for work with adults. These materials are quite useful, since once the student knows what he is to do, he can work on his own for several hours with the minimum assistance from the instructor.

Cuisenaire Company of America, Cuisenaire Rods, Cuisenaire Company of America, Mt. Vernon, New York.

These are mathematics learning rods that can be used to explain simple and complex mathematical operations. They are especially useful in showing size relationships.

Editorial Staff, Steps to Learning - Book 1, Steck-Vaughn Company, Austin, Texas, 1965.

A beginning book for adults who are ready to learn to read. Sight-sound associations are used extensively with the assistance of pictures. The book also contains extensive handwriting exercises and some number problems. This book is designed as a reading and workbook for the uneducated adult.

Greene, H. A., et. al., Building Better English, Row, Peterson and Company, Elmsford, New York, 1962.

This is a seventh grade English Grammar textbook. The book discusses all the various phases of English grammar and has many exercises to test the understanding of the rules. The book is suitable for clients who read at at least a seventh grade level.

McSwain, E. T., et. al., Understanding Arithmetic, Laidlaw Brothers, River Forest, Illinois, 1956.

This is a fourth grade arithmetic text that was used frequently at the Navajo Rehabilitation Project before newer materials, more suitable for work with adults, were available. It is suitable for its purposes, but has the disadvantage of using examples from a child's world and may seem silly to adult students.

Mitchell, Elizabeth G., Beginning American English, Prentice-Hall, Inc., Englewood Cliffs, N. J., 1957.

This book is designed to teach oral and written English to non-English speaking adults. It was written with the intention that the Instructor need not know the language which his students speak. It is suitable for work with mixed language groups. Word meanings are understood through accompanying drawings in the text. This is a good book for teaching oral English.

Reader's Digest Services, Reading Skill Builders, Pleasantville, New York, 1958.

A series of readers for first to eighth grade reading levels. The stories are written at an adult level of interest, and are taken from the Reader's Digest. Exercises at the end of each story are available to test for understanding.

Robertson, M. S., Learning and Writing English, Steck-Vaughn Company, Austin, Texas, 1964.

This is a self-help book for adults who can read at the third to fourth grade level. The book is primarily designed to teach the writing of correct English. It includes proper use of verbs, writing letters, capitalization, punctuation, etc. An excellent book for adults who want to learn more about English grammar.

Robertson, M. S., Adult Reader, Steck Company, Austin, Texas, 1964.

This is a beginning reader for adults. It begins with short, simple sentences, and there is much repetition. The content material is based on adult interests, and was enjoyed by Navajo Rehabilitation Project clients who used it.

Shea, J. T., Working With Numbers, Steck Company, Austin, Texas, 1957.

A useful workbook in arithmetic. Examples of problems completely worked out are given on each page, followed by problems for the student to do. There are different grade levels available.

Smith, H. A. and Wilbert, Ida, I Want to Learn English, Steck-Vaughn Co., Austin, Texas, 1965.

A language arts workbook for adults. It is written at about the third to fourth grade level. Its purpose is to build better speaking and writing habits and to develop and strengthen skills in reading.

Smith, H. A. and Wilbert, Ida, I Want to Read and Write, Steck-Vaughn Company, Austin, Texas, 1965.

An adult reader that introduces reading and writing skills. This book, as well as Robertson's Adult Reader, is a good introductory reading text and workbook for adults.

Varnado, E. M., English Essentials, Steck Company, Austin, Texas, 1964.

This combination text-workbook is a good review of English usage for the more advanced student. It would be most easily used by those students with seventh to twelfth grade reading level.

Wallace, Mary C., Figure It Out, (Books 1 and 2), Follett Publishing Company, Chicago, 1965.

Book 1 is a review of the basic arithmetic essentials. It can be used as an introductory arithmetic workbook if supplemental instruction is given. Book 2 is an excellent text-workbook for introducing fractions, decimals, and percentages. The text is written at about a fourth to fifth grade comprehension level, and uses adult experiences in the examples and illustrations.

Wheat, H. G., et. al., Row-Peterson Arithmetic (2nd Edition), Row, Peterson, and Company, White Plains, New York, 1959.

This text book is written for an eighth grade arithmetic class, but may be used satisfactorily with adults who are able to work at this level. It was used extensively at the Navajo Rehabilitation Project and seemed adequate, though it does not use a modern math approach.

Wycliffe Bible Translaters, Learning English, Navajo Missions Press, Farmington, New Mexico.

Wycliffe Bible Translaters, I Want A Job, Navajo Missions Press, Farmington, New Mexico.

Wycliffe Bible Translaters, Let's Read Navajo, Navajo Missions Press, Farmington, New Mexico.

The above three listings are Navajo-English Readers designed to teach the reading of Navajo, and to compare the Navajo and English languages. They may be used to teach the Navajo language to English-speaking peoples who want to work on the Reservation, or to teach Navajos more English.

APPENDIX E: Validity Data On The Tests Used In The Educational Evaluation

The Wide Range Achievement Test (Jastak, 1946) is designed to test achievement level from kindergarten to college in the areas of reading, spelling, and arithmetic. The test was designed for use as a clinical test. The Author's reliability coefficients for repeated testing ran from .88 for Spelling to .95 for Reading. Criticism of the test is given by the reviewers in Buros' Third Mental Measurement Yearbook (1949, Pp. 46-48). They believed the test was not adequately standardized, since correlations with various sections of the Stanford Achievement Test were substituted for direct standardizing on a national scale. These correlations range from .81 to .93 at the seventh and eighth grade levels. Douglas stated that the Wide Range Achievement Test appears to have adequate face validity as a coarse screening measure in the three areas tested (Buros, 1949, P. 47).

The Wide Range Achievement Test was used in the Educational Evaluation to ascertain the approximate achievement level of Navajo clients. If the client made scores above the third grade level on the Wide Range Achievement Test, he was given a more extensive and accurate achievement battery, the Iowa Tests of Basic Skills. The Wide Range Achievement Test was useful because of the relatively short time it takes to administer (about 45 minutes). Also, on the Arithmetic section the mechanics of arithmetic are tested rather than verbal problems which require skill in reading. This meant that Navajo clients who read poorly had a better chance to demonstrate their arithmetic computational skills.

The Iowa Tests of Basic Skills (State University of Iowa, 1956) have as their purpose the measurement, at the third to ninth grade levels, of certain skills involved in reading, word study, language, and arithmetic. In reviewing the test, Herrick states that the focus of the tests is on the evaluation of generalized ability rather than on specific content achievement (Buros, 1959, P. 30). This achievement battery is praised highly in Buros' Fifth Mental Measurement Yearbook (1959). The reliability coeffi-

cents range from .84 to .96 for the subtests. Composite score reliabilities for the entire test range from .97 to .98 for the different grades. The test is thus highly reliable. The reviewers praise the standardization procedures and feel confidence in the stability and representativeness of the norms and the comparability of the two forms. The test has adequate curricular and statistical validity. The only weakness in standardization data is the absence of information concerning the predictive validity of the test; however, the reviewers feel the correlations with academic success should be as adequate as those for the older Iowa Every-Pupil Test. (Buros, 1959, Pp. 30-37)

The Iowa Tests of Basic Skills battery was the evaluatory measuring device used in the educational evaluation. There are two comparable forms of the test and one was used as the pre-test measuring device and the other as the post-test measuring device. Any significant gains made on the second test were assumed to be an increase in actual achievement level on the part of the client as a result of remedial education and other experiences in the evaluation process.

The Gilmore Oral Reading Test (Gilmore, 1951) is designed to analyze a child's oral reading performance in Grades 1 through 8. The test measures accuracy, comprehension, and rate of oral reading. There are two equivalent forms of the test, A and B. Each form contains ten reading paragraphs, followed by five comprehension questions for each paragraph.

Statistical evidence of the validity of the tests was obtained from a comparison of scores made by twenty-four fifth grade pupils of the same age on this test and on Gray's Standardized Oral Reading Paragraphs and the Durrell Analysis of Reading Difficulty. Correlations ranging from .39 to .80 are reported, with medium correlations for the comprehension scores. Normative test data is based on a standardization program involving 1,620 pupils in five states. Duggins, in reviewing the Gilmore Oral Reading Test in Buros' Fifth Mental Measurement Yearbook, feels that the face validity is so obvious that the scanty statistical evidence of validity should not deter its use. (1959, Pp. 767-768). The alternate-forms corre-

lations for groups of second, fifth, and seventh grade pupils indicate reliability coefficients of .68, .67, and .52 for comprehension scores. Kuder-Richardson coefficients are higher for comprehension (.82, .78, and .78).

Shoemaker, Byrl R.
A Position Paper on Vocational Education in the Public Schools.

Ohio State Dept. of Education, Columbus
MF AVAILABLE IN VT-ERIC SET.
Pub Date - 65 11p.

*VOCATIONAL EDUCATION; *EDUCATIONAL PHILOSOPHY; ACADEMIC ACHIEVEMENT; TEACHER INFLUENCE; COMPREHENSIVE PROGRAMS; *PUBLIC SCHOOLS
OHIO

The primary purpose of vocational education is to equip persons for useful employment. Vocational education helps to give definite purpose and meaning to education by relating it to occupational goals. Vocational education is not a discipline, but it cuts across and draws content from a number of disciplines and from the practical work of the world. A research study completed by the Division of Vocational Education in Ohio revealed that students enrolled in depth programs of vocational education in the trade and industrial field achieved significantly higher scores on trade achievement tests than did students who were enrolled in programs requiring less of the students' time for vocational education. Another research study, also concerned primarily with trade and industrial education, pointed up the importance of competence in occupational skills and knowledge on the part of the teacher as being the one teacher factor making a significant contribution to student achievement. Other significant findings of these two studies are listed. (PS)

A POSITION PAPER ON VOCATIONAL EDUCATION IN THE PUBLIC SCHOOLS

by

Byrl R. Shoemaker

Director, Vocational Education, Ohio

VT005002

A definition or description of vocational education could be worded as follows:

The primary purpose of vocational education is to equip persons for useful employment. The program is designed to serve the needs of people in two distinct groups. First, adults who have entered upon, and second, youth and adults who are preparing to enter occupations in agriculture, business, home making, distribution, trade, technical, and industrial fields requiring less than a college degree.

Vocational education helps to give definite purpose and meaning to education by relating it to occupational goals. It provides the technical knowledge and work skills necessary for employment; but, it is more inclusive than training for job skills. It develops abilities, attitudes, work habits, and appreciations which contribute to a satisfying and productive life.

Vocational education contributes to the general educational needs of youths, such as citizenship, respect for others, acceptance of responsibilities; but, it makes its unique contribution in the field of the preparation for work. It is a part of a well-rounded program of studies aimed at developing qualified, efficient workers. It recognizes that the American worker should be competent--economically, socially, emotionally, physically, and in a civic sense.

The uniqueness of the vocational education program in our public schools is in its contribution to the skills and technical knowledge required for employment. Recognizing the needs of youth and adults for instruction in the field of occupations, no educational program or school can be classed as comprehensive unless the educational offerings include a comprehensive vocational education to serve youth and adults.

It is my belief that vocational education is not a discipline, but that it cuts across and draws content from a number of disciplines and from the practical work of the world. The contribution of vocational education is the blending of theoretical knowledge from the disciplines with the practical experiences and requirements of entry jobs, recognizing the nature of the world of work.

In vocational education we weave together the principles of mathematics and science, skills, and technical knowledge into a mix which will help youth and adults to enter and ad-

just to employment opportunities or to upgrade themselves in their chosen field of work.

A preparatory program of vocational education is essentially a "core" program built around the "pegged-core" concept of Dr. Alberte, Professor Emeritus, Ohio State University. The program makes significant use of the concepts or principles of learning which point out the importance of relationship of knowledge taught to effective use by the student of such knowledge.

Some principles of learning serving as the basis for instruction in the field of vocational education are as follows:

1. We learn best when we are ready to learn. When we have a strong purpose, a well fixed reason for learning something, it is easier to receive the instruction and to make progress in learning.
2. The more often we use what we have learned the better we can perform or understand it.
3. If the things we have learned are useful and beneficial to us, so that we are satisfied with what we have accomplished, the better we retain what we have learned.
4. Learning something new is made easier if the learning can be built upon something we already know. It is best to start with simple steps which are related to things we can now do or which we already understand, and proceed to new and more difficult tasks or ideas.
5. Learning takes place by doing. Before the learning can become complete, we must put into practice what we are attempting to learn.

It is my opinion that the most significant contributions of any of the social sciences to the field of vocational education have come from the field of psychology.

Vocational education is not the total answer to the over-all unemployment problem brought about by cyclical and structural changes in our employment pattern. Vocational education is one of the answers for unemployed individuals who wish to prepare to re-enter the labor market, and for youths in high school or post-high school levels who are preparing to enter the labor market for the first time.

I would predict that when the answer to the problem of unemployment is found, vocational education will have a prom-

inent part in the solution. This prediction is based upon the concept that the new technological revolution brought about by automation has placed a premium upon preparation in skills and technical knowledge for new jobs, and has diminished the need for the unskilled worker.

As the governmental unit in our society works frantically to develop the "Great Society," a greater and greater reliance is being placed upon the concept of education as the only ladder out of a continuous poverty cycle.

Secretary of Labor Wirtz made this challenge clear as he made this statement before the general subcommittee on education in the National Congress.

> There was a place in the old work force for the boy or girl who left high school, either dropping out, or with a diploma in hand, and entered the work force with no skilled training. He or she could, and did take an unskilled job and worked up from there. Now, such jobs are vanishing, and so, today, there are 700,000 sixteen to twenty year olds out of work and out of school. Every American youngster has to be given today, as a part of his education, some know-how about making a living, which means for a great many of them. vocational education.

A review of a June, 1965, report on unemployment in Ohio reveals that when the unemployment of males is considered by each age category, the largest percentage of unemployment exists within the youth between the ages of sixteen and twenty-four, and that the vast majority of the unemployed in this category are classed as unskilled workers. This points up the great need in the youth group for preparatory training for employment.

The need for upgrading courses for employed workers is in evidence, particularly for the worker thirty-five years of age or older. Both upgrading and retraining courses are important for the worker in the forty-five years of age and over category.

Looking at the pattern for women, we find again that unemployment is highest among the unskilled youth group. A review of the unemployed youth pattern would indicate that there is a need for training girls in occupations other than clerical and business occupation. Other occupations, however,

such as cosmetology, dental assistants, medical assistants, laboratory assistants, and technical areas such as food service and food management, child care, etc., should be given consideration for the training of girls and women.

The pattern of employment and unemployment for women points up the need for the retraining of persons who are reentering the labor market at about age thirty-five. There is little indication, however, of the need for the training of older women workers, since they seem to retire earlier than men, or else do not change jobs as an older worker.

Reports from both the Ohio State Employment Service and the United States Department of Labor point out that the jobs available between 1960 and 1970 and subsequent periods of time will require skills and technical knowledge, and that the unskilled person earning his living with his back is in danger of becoming obsolete.

It is a professional person's desire, and an administrator's obligation, to project his plans as far in the future as possible. I find it difficult, however, to talk now about the preparation of youth or adults for jobs to be available in 1975. It is true that for some the academic studies will enhance their chances of employment. The problem, however, is stated succinctly by Grant Venn in the book entitled Man, Education, and Work, published by the American Council on Education.

> Their assumption seems to be that the best and only necessary preparation for a job today is the longest possible immersion in academic and professional subjects.
>
> This assumption at once fails to heed the factor of youth unemployment and misapprehends the relevance of general education. The liberal, or academic, studies do enhance the long-range civic and occupational competence of a person; they do not, at least below the baccalaureate degree level and as a rule, qualify young people for meaningful job entry. The technological work world is one of specialization and sophisticated skills, and being a 'bright young man' cuts relatively little ice with employers looking for skills to do some specific kind of work.

It is impossible for me at the present time to project the job pattern in 1975; but, it is within my range of abilities to provide for sound entrance programs today, and to encourage

a flexible curriculum, flexible facilities and flexible program offerings for those vocational education programs now functioning within our State.

The term "flexibility" has become quite popular and, in too many cases, may mean the concept of lowering the investment of time by the student in a program of vocational education in order to enhance his opportunities to enroll in courses of mathematics and science and other related disciplines. There is a real question as to whether this type of flexibility improves either his vocational education or his abilities in mathematics and science.

The Division of Vocational Education, in cooperation with the Ohio State University, has completed two research studies involving the question of depth of training for students enrolled in vocational education.

From the one study, it is evident that students enrolled in depth programs of vocational education in the trade and industrial field achieved significantly higher scores on trade achievement tests than did those students who were enrolled in programs requiring less of the students' time for vocational education and making available a greater portion of the students' time for liberal and academic studies.

A further study of the report reveals the fact that students enrolled in a more flexible program requiring less time in the vocational areas do not achieve more in the area of mathematics and science than those who continue in depth programs of vocational education. To the contrary, those students who remained enrolled in depth programs in vocational education showed a significantly higher achievement in understandings of principles of mathematics and science than did the students in the more flexible programs.

Too often the value of a sound vocational education program to the total educational process has been overlooked by those imbued with the concept that the college preparatory curriculum is the "general education" curriculum that all students can and should follow. The contribution of vocational education to the total curriculum is alluded to by Dr. Conant in the January issue of "Changing Times." Dr. Conant was asked the question, "Dr. Conant, suppose that one or more of the children in a family are not interested in going to college?"

His answer was, "Along with its academic courses the high school should offer a vocational program. Thus, a boy could develop an occupational skill which would interest him such as automobile mechanics, tool and die work or carpentry. This would also stimulate him to learn mathematics, history, social studies and English, since he would now see the point of it all. Girls might take such courses as stenography, typing or home economics."

The research study reported earlier in this paper has indicated that the interest and growth in the areas of mathematics and science takes place under the following conditions:

1. The instruction is a required part of the vocational program.
2. The instruction is provided in a block of time separate from the skill instruction but correlated with such skill instruction.
3. The students are taught in homogenous groups according to the occupational area which they are studying (i.e. machine trade, auto mechanics, etc.).
4. The principles of science and functions of mathematics are taught in relationship to the real problems in the occupation for which the student is preparing.
5. The principles of science and the functions of mathematics are selected on the basis of applicability to the occupational area and taught at the "applied" rather than "proof" level.

The report from one large city indicated that less than fifteen percent of the students were enrolled in the higher mathematics and science courses at the eleventh and twelfth year level. A much higher percentage of the students will need mathematics and science following graduation. Not all students who need mathematics and science need the "proof" type of instruction provided in the college preparatory mathematics and science programs. The students who are not going on to college do not have the goal orientation necessary to encourage success in the college prep classes and many do not have the apitude or ability to succeed.

Often the next obvious solution attempted is the establishment of "general," "shop," or "applied" mathematics courses which place all students not in the college preparatory

courses into classes together or all vocational students in such common courses. The history of such courses has been poor. The goal orientation in such classes is no more clear for the students not planning to go to college than in the college prep courses, even though the content may be functional or applied. Functional in what way? Applied to what? What does the boy in an auto mechanics vocational program care about the functions of trigonometry as applied to the machine trade. As a matter of fact, why should the boy in auto mechanics be required to learn the functions of trigonometry? Unused knowledge is soon forgotten and the auto mechanics student has no use for trigonometry.

Vocational education should not be considered principally as a means to teach principles of mathematics and science but as a program which incorporates them in reaching a goal of preparing to live and to earn a living. Vocational programs prepare students for entrance into a family of occupations, not into "a" job. As an example, vocational training in the auto mechanics field would be basic to approximately 750 of the jobs listed in the occupational handbooks. A comprehensive vocational program will offer a wide variety of programs to meet the interests and abilities of the students at the high school level and the out of school youth and adults. A minimum comprehensive program would include:

Three different agriculture programs
Three different business and office programs
Two distributive education programs
One job training area relating to home economics
Five trade and industrial education programs

The following program of vocational education included in the Penta-County Joint Vocational School District would be considered a desirable or optimum comprehensive program.

High School Programs

A. Agriculture
   1. Training for non-Production Agricultural Occupations
   2. Vocational Horticulture
   3. Advanced Farm Business Management and Accounting
   4. Advanced Agricultural Equipment and Mechanics

B. Business Education
   1. High Skill Steno/entry Secretarial 11-12
   2. Account Clerk 11-12
   3. Entry Business Data Processor 11-12
   4. Office Machines Operator 11-12
   5. Cooperative Office Education (12th only)
   6. Office Reproduction Specialist 11-12
   7. Intensive Horizontal Business Office Education (12th only)

C. Distributive Education
   1. Retail Selling, Buying and Pricing of Merchandise and Personnel Management

D. Home Economics
   1. Child Care Assistant
   2. Child Care Worker
   3. Homemaker's Assistant
   4. Dietary Aide

E. Trade and Industrial Education
   1. Machine Trades
   2. Auto Mechanics
   3. Auto Body Repair
   4. Cosmetology
   5. Drafting
   6. Electrical Construction
   7. Commercial Art
   8. Carpentry
   9. Dental Assistant
   10. Medical Laboratory Assistant
   11. Industrial Electronics
   12. Welding and Sheet Metal
   13. Commercial Foods
   14. Printing

F. Occupational Work Experience Program

Technical College

Data Processing Technology
Chemical Enginnering Technology
Electrical Engineering Technology
Mechanical Engineering Technology
Civil Engineering Technology
Tool and Manufacturing Engineering Technology

Welding Engineering Technology
Accounting
Food Service Management
Wholesale Management
Others

One other research study, also concerned primarily with the area of trade and industrial education, points up the factor of the importance of competence in occupational skills and knowledges on th part of the teacher in the area in which he is teaching as being the one teacher-factor making a significant contribution to student achievement. Other significant findings of this research are:

1. The expenditure spent per student in Ohio's trade and industrial programs as viewed in this study was a significant contributor to student success. The amount spent per student in the high-achieving groups was over $100 more than the amount spent per student in the low-achieving groups.
2. Teacer personality, in terms of self-concept, is an indicator of how students will achieve. Teachers of the high-achieving groups displayed a higher Intellectual Quality concept than did teachers of the low-achieving groups.
3. Local supervisors' ratings of teachers are significant indicators of quality learning situations.
4. Teacher age, grade level completed, years of teaching experience in present trade, total teaching experience and degree held do not appear to be significant factors in student success. Teachers industrial experience is a significant positive factor in relation to student achievement.
5. Trade and industrial education teachers are considerably more motivated than the normal population.
6. Student intelligence is a factor in trade achievement; however, some of the low-achieving schools reported mental maturity scores at or above those of the high-achieving schools. The teacher and the environmental factors also contribute to the differences found in the students' achievement.
7. Teachers who are creative, as measured by the Opinion,

Attitude and Interest Survey, are typically rated by local supervisors as poor or poorer performers. Students of teachers who are identified as creative but have low Intellectual Quality scores achieve at a lower level than do other students.

8. Facilities as evaluated by area supervisors are a factor in quality programs. Shop space and equipment are essential for quality performance by students.

There are those who suggest that the problem of training students ought to be turned over to the industries. Such statements lack an understanding of the competitive nature of modern industry and business and underestimate the ability of the public educational sector of the total education program to provide instruction for entrance into business and industry and upgrading courses for employed workers on a reasonable basis from the standpoint of both cost and effectiveness.

One indication of the unwillingness of business and industry to train an adequate number of workers for their employment needs is evidenced in the area of apprenticeship training. It is estimated by the United States Department of Labor that a total of five million new skilled workers will be needed between the years of 1960-1970. The industrial pattern for training these people within industry is the apprenticeship training program. At the present rate of training through qualified apprenticeship training programs, there would be a shortage of half million a year over each year of the projection.

Vocational preparatory training, upgrading, and retraining can be done effectively and economically through the public education sector of our society. The modern vocational education programs will be characterized by flexible facilities, an evolving curriculum, up-to-date equipment, a broad preparatory vocational-technical program at the high school and post-high school levels, a continuing educational program for upgrading of employed workers, a continuing retraining of the unemployed workers, and last, and perhaps most important, a competent staff and leadership to assess the needs and to adjust the programs.

Young, Robert C.
Planning for Technical Education in the CMD (Calcutta Metropolitan District), an Outline.

MF AVAILABLE IN VT-ERIC SET.
Pub Date - Jan67 41p.

*TECHNICAL EDUCATION; *EDUCATIONAL PLANNING; *PROGRAM DEVELOPMENT; EDUCATIONAL NEEDS; EMPLOYMENT OPPORTUNITIES; PROGRAM ADMINISTRATION; EDUCATIONAL FACILITIES; INSTRUCTIONAL STAFF; EDUCATIONAL FINANCE; *TRADE AND INDUSTRIAL EDUCATION; APPRENTICESHIPS; MANPOWER DEVELOPMENT; DEVELOPING NATIONS INDIA; CALCUTTA METROPOLITAN DISTRICT

This paper presents an outline upon which a technical education plan could be developed for the Calcutta Metropolitan District of India. Increased employment of craftsmen and skilled office workers was anticipated to meet industrial needs. Some important questions to be answered were (1) Who will administer and finance this training? (2) Who should receive the training? (3) How many workers should be trained? (4) What will be the quality of their training? (5) Where will capable instructors be found? and (6) Where should these training programs be conducted? Background information and proposals for a technical education program were presented for discussion purposes prior to the preparation of a comprehensive technical education plan. It was recommended that a series of project studies which could involve in-plant training, junior technical schools, information systems, trade analyses, government support, and followup studies of graduates would be highly desirable. The appendixes list a report on Vocational Training in France and a note on the rigidity in technical education. (WB)

PLANNING FOR TECHNICAL EDUCATION IN THE CMD AN OUTLINE

BY

ROBERT C. YOUNG

January 1967

ACKNOWLEDGEMENTS

I want to thank especially Dr. H. Banerji for the many useful suggestions he has contributed to this paper. It is through our discussion with one another and other specialists in the CMD technical training community that this paper has evolved. Special mention must also be given to S. K. Dutta (Economics Section) and Bruce Mecartney, who have also contributed many useful ideas and valuable time. To those outside CMPO I am also heavily indebted but their names, though often very important in the ideology presented herein, are too numerous to be represented here. To all, however, I am deeply grateful.

PLANNING FOR TECHNICAL EDUCATION[1] IN THE CMD

AN OUTLINE

INTRODUCTION

The Calcutta Metropolitan District is anticipating a rapid increase in employment during the coming decades, and much of the six lakhs increase in industrial employment and 12 lakhs increase in total employment between 1966 and 1976 will have to be in the skilled category. One way or another these craftsmen and skilled office workers will receive some form of training essential for the performance of their job.

Numerous important questions remain unanswered; Who will administer and finance this training? Who should receive the training? How many should be trained? What will be the quality of their training? Where will the instructors be found who are willing and capable of providing such instruction? Where should these training programmes be conducted?

This outline attempts to (1) present an outline upon which a technical education plan could be developed, (2) raise some of the questions that must be considered in preparing such a plan, (3) present some of the ideas which have occurred to the author during his study of India's technical education system, (4) present some of the background material necessary for the development of a technical education plan, and (5) give some idea of the magnitude of the problem in preparing a comprehensive technical education plan.

SUMMARY AND CONCLUSIONS

This paper is not intended to be a work programme, for the question raised implicitly and explicitly in this paper should be discussed within CMPO prior to the allocation of staff to the further study of technical education. A work programme that might result from such discussions could take any of several directions among which are the following:

(1) A quick and rough manpower projection and technical education plan using current ratios and best guesses regarding sectoral rates of growth, changes in technology, and training requirements to be provided by the various training programmes (ITI's, apprenticeship schemes, etc.) for each occupation to determine the scale of the plan.

---

[1]"Technical education", like "vocational education," will be used in this outline to mean any systematic presentation to a student body of information and techniques intended to facilitate the future efficient performance by the students of a particular set of tasks assigned them by their employer. This level of instruction will be given those who have already completed class eight, class eleven, and the Industrial Training Institutes (ITIs) but will be more advanced than the craft training conveyed in the primary schools or junior secondary schools and it will not be as advanced as that training given in the degree courses of colleges or universities. "Graduate" will be used in this paper to mean anyone completing successfully a curriculum and examination offered by an educational or training institution. Thus it will be more inclusive than the usual Indian usage, where it refers only to degree holders.

(2) A comprehensive technical education plan examining as many of the questions raised in this paper, and other questions, as they arise, which are deemed relevant to a well conceived plan, developed through consultation with industry, other branches of government, and the academic community and which will prove of reasonable financial proportion and political acceptability.

(3) A series of project studies rather than a comprehensive plan, the subjects of the studies perhaps falling along lines such as these: in-plant training and its effectiveness; rigidity in technical education; follow-up studies of those passing out of polytechnics, ITI's, and junior technical schools; and information system to guide technical education planning; trade by trade analyses of the supply and demand for skilled manpower (groups of trades within one industry may be handled together); and, government support for an industrially managed technical education system.

Considering the difficulty of the subject matter, its extremely broad scope and the current availability of personnel in CMPO, the latter alternative would seem the most fruitful. This alternative could, in fact, eventually evolve into a comprehensive plan, and in any case such studies would be extremely useful in providing the groundwork for appraising the current system and possibilities for the future. The speed with which they are undertaken will obviously depend upon the calibre of the staff assigned to them. The studies could lead to immediate policy propcsals without waiting for the completion of a comprehensive plan, and in so doing could have immediate repercussions on the economy.

None of the propositions in this paper are put forth with a sense of absolute finality, for all of them are subject to alteration resulting from more detailed research and its revelations. This paper is put forth merely to present a few ideas which the author feels worthy of further discussion within and beyond CMPO. He hopes that it is with this objective in mind the paper will be read. The tentative conclusions of this preliminary inquiry into technical education are as follows:[1]

(1) Technical education outside the formal technical education system should be strengthened through improved in-plant training, better general secondary education, an external examination system, evening courses, and adult education courses in fields related to industry and commerce. (III.C.; IV.C.)

(2) The technical education system should be made increasingly flexible through an improved information system to structure the output of students from the technical training institutes, so that as old bottlenecks are broken and new manpower shortages appear, the training system will similarly change the composition of its training programme. (III.Cvii.; IV.A.; IV.C.; Appendix I).

---

[1]The figures in brackets indicate the section of the paper in which the proposition is followed up either in detail or in context.

(3) The formal technical education system needs to be strengthened through the provision of better instructors, programmed materials, and an improved curriculum. (I.I.; II.F.; III.C.vii.)

(4) Wastage in training should be minimized by training only the more mature and those with strong commitments to the occupations in which they receive their training. (I.B.; II.B.; II.D.; II.E.)

(5) A careful assessment should be made of the effectiveness of formal and informal on-the-job training programmes. (I.E.; II.E.; III.C.; IV.A.)

(6) The Industrial Training Institutes (ITI's) should be resorted to only where on-the-job training programmes are shown inadequate to meet demands for trained personnel or where the costs of the subsidy for ITI training are less than the costs of in-plant training while being equally effective. (II.B.; III.C.)

(7) The junior technical schools should be either abolished or converted to post-secondary training institutions along the lines of the ITI's. (I.B.; II.B.; III.C.iii.)

(8) As most of the production process workers are trained on-the-job rather than in pre-employment training programmes, improvement and expansion of the general secondary education system would greatly facilitate this in-plant process. (II.A.; III.C.iv.)

(9) The CMD should be very selective in its future investment in technical training. (III.C.)

(10) Industry should be given increased responsibility for formal training wherever it is necessary. (III.C.vii.)

(11) Social and occupational mobility within the training programmes and their corresponding occupations should be examined to determine the degree of freedom of entry and monopolistic inefficiency. (III.C.i.)

(12) An examination system along the lines of the University of London's external degree programme but at the level of production process workers and other skilled manpower should be implemented as a means of stimulating private training programmes and providing recognition to their successful trainees. (III.C.v.)

(13) Consideration should be given to the possibility of and benefits from reimbursing industry up to the cost of ITI or polytechnic training for producing an increased quantity of trainees. This training programme might take the form of either an off-hours training programme, utilizing the staff and equipment currently operating on the assembly line (by paying overtime wages plus compensation for depreciation), an intensified apprenticeship programme, or new training schools managed by the industry, whichever would be mutually agreeable in the eyes of industry and government. (I.F.; I.I.; III.C.vi.; III.C.vii.; Appendix I)

I. TODAY'S TECHNICAL EDUCATION PROGRAMME

I.A. ORGANIZATIONS PARTICIPATING IN TECHNICAL EDUCATION

One of the most important of the organizations in the field of technical education is the All-India Council of Technical Education, whose job it is to advise the country regarding methods and programmes of technical education. The AICTE "is composed of representatives of Union and State Governments, Parliament and associations in the fields of commerce, industry, labour, the professions and education. Though the Council has advisory functions only, experience shows that its recommendations have invariably been accepted by the Union and State Governments". The AICTE has four Regional Committees, one of which is located in Calcutta[1] and their responsibilities are to serve the same function for their respective regions that the AICTE does for the nation as a whole. The AICTE has established seven Boards of Technical Studies "to advise the Council on such technical matters as the preparation of model courses of studies, laying down standards and regulating the award of national diplomas." As a result of an AICTE recommendation, the Government of West Bengal, as have all other states, has set up a Board of Technical Education, with whom CMPO will have to work closely if it is to develop a technical education plan for the CMD.[2]

In addition to these agencies of the AICTE, there are numerous other governmental organizations that are directly involved in the process of technical training, and among them are the following: the Board of Secondary Education of the Government of West Bengal (GWB); the Technical Education of the Education Department, GWB; the State Apprentice Advisor in the Department of Commerce and Industry, GWB; the Industrial Training Institutes of the Department of Commerce and Industry, GWB; the Central Training Institute of the Government of India, GOI; the National Council for Vocational Training (GOI); the Education Ministry of the GOI; the Ministry of Railways, GOI; the Refugee Rehabilitation programmes of the GWB and the GOI; the Ministry of Iron and Steel; and the Labour Ministry, GOI.

These government training efforts are, of course, greatly supplemented by private training programmes, some of which are partially supported with governmental funds and some of which are totally independent of government. One example of the former are the various governmentally supported but privately operated technical schools, and examples of the latter are the Calcutta Technical School and the several commercial colleges conveying office skills of the stenographic and secretarial variety. In addition to these, of course, are many on-the-job training programmes where unskilled labour gradually learn the skilled craft through observation and inquiry rather than formal training.

---

[1] The others are in Kanpur, Madras and Bombay.

[2] Ministry of Education, Government of India, Education in Eighteen Years of Freedom, 1965.

In order to develop a balanced and integrated technical education plan, all of these organizations and programmes would have to be consulted and/or considered, else the output of one programme may be of unwarranted cost considering alternative costs and means of training utilizing another programme. For CMPO to hope to develop such a plan without the cooperation, say, of the Regional Committee of the AICTE, the State Board of Technical Education, the National Council for Vocational Training, or the Department of Commerce and Industries, would be futile, for the advice and experience of these branches of government will be vital to the coherent development of the plan. The fact that it will be these other agencies, rather than CMPO itself, that will implement the plan is another extremely crucial reason for their involvement in its formulation.

In the development of the plan the opinions and experience of the academic community must also be considered, and interviews should be held with members of the IITs, the IIM, and the economics departments of Calcutta and Jadavpur Universities, some of whom may have had considerable contact with industry and its training problems. Nor should the experience of the business community be overlooked[1], and it should be contacted directly through some of the individual firms as well as indirectly through its associations, such as the Indian Engineering Association and the Indian Chemical Manufacturers Association. All of these groups are directly or indirectly involved in the provisions of skilled manpower to the economy, and all, hopefully, will have useful ideas to contribute to the construction of a technical education plan.

I. B. FORMAL TECHNICAL EDUCATION

A very important part of the technical education of any country or region is that which takes place within institutions established primarily for the provision of such training. Among such institutions are the ITIs, the CTIs, the junior technical schools, the Calcutta Technical School, and various other private technical training institutions. Some of these combine formal academic (mathematics, physics, and chemistry) programmes with in-plant training while others are entirely pre-employment training, provided entirely within the training institution itself. Their distinguishing feature, however, is that they are primarily a vocational training institution rather than a special programme within an organization whose basic objective is other than the provision of skilled personnel.

To assess the current performance of the CMD's technical training system, estimates should be made of the total output of trained craftsmen from such institutions, the cost and quality of their training, their success in finding positions utilizing their new skills following completion of the training programme, and other skills that may be developed through this approach. The cost and quality estimates as well as some

---

[1]Although business is represented in the AICTE, the latter is an all-India organization, and in dealing with a plan for Calcutta, more localized experience would be useful.

information regarding the post-training employment achieved by the students will all be crucial in the construction of a rational training programme, based on the comparative costs of various training programmes.[1]

Not only will decisions have to be made regarding the allocations of students between formal training programmes and other training systems, such as the apprenticeship scheme, but within the formal technical education programme decisions must be made regarding, for example, the expansion of the junior technical schools relative to the ITIs, and thus investigation must determine the relative merits of the various programmes within the formal technical training schemes. Therefore, it, as reported by the Education Commission[2], the junior technical schools have a high wastage rate and a significant percentage of those who do pass out do not enter employment but rejoin the education stream either in the pre-university courses or the polytechnics, then this might indicate that youth at this age were too young to receive such specialized training and that such training might be best deferred until completion of, say, the eleventh class or perhaps even until after they have been employed for some time and have a commitment to a job or an occupation.

I. C. APPRENTICESHIP
